Final Report No. 4.4

Volume 2 of 3

Appendices

1. Groundwater Study of Agroclimatic Zone I (a)

1.1 General

The ACZ I(a) covers an area of 45,577.83 km^2. It comprises parts of the districts of Barmer and Jodhpur. The average annual rainfall in ACZ is 270.2 mm. The mean annual evaporation is 232.9 mm.

1.2 Geology

Geologically the ACZ comprises sedimentary, igneous and metamorphic rocks. The northern part of ACZ is occupied with carbonate and sedimentary rocks which mainly comprise limestone and sandstone rock formations of Jurassic, Cretaceous and Tertiary age. The western part comprises sedimentary and volcanic rocks and southern part comprises mainly alluvial deposits.

1.3 Hydrogeology

Hydrogeology of hydro-strategraphic units as aquifers occurring in ACZ is described in following paragraph. Area occupied by various aquifer units in different blocks and districts of covering ACZ is given in Table 1.4-1. Hydrogeology map of ACZ I (a) is at Drawing No. ACZ I(a)-001.

Alluvium

Recent alluvium mainly comprises aeolian and fluvial deposits consisting of sand, silt and clay. It encompasses extensive areas in the south and east of Barmer district and in southern part of Jodhpur District, mainly in the flood plains and drainage courses of Luni River, Mithri River and Jojri Rivers. It forms potable aquifer in Luni block of Jodhpur district and Dhorimanna Sindhari, Balotra block of Barmer district. The thickness of the alluvium ranges from 40 to 100 m. Groundwater in the alluvium occurs under water table to semi-confined conditions. The yield of tube-wells ranges from 0.54 to 6.56 lps with a drawdown of 6 to 35 m, whereas that of dug wells it ranges from 0.23 to 0.81 lps.

Tertiary Sandstone

This is white and grey coloured argillaceous sandstone, hard and compact with occasional bands containing well-sorted pebbles of Malani volcanics. It forms an aquifer of good potential and overlies crystalline basement located at a depth of about 100 m. The yield of tube-wells tapping Tertiary sandstone and associated shales ranges from 1.54 to 3.47 lps with a drawdown of 0.6 to 2.55 m.

Lathi Sandstone (Jurassic)

This is white to grey, friable sandstone intercalated with beds of ferruginous sandstone and shale. Lathi sandstone occurs around Sheo block and is a potential aquifer. The Lathi sandstone varies in thickness from 100 m in the east to 800 m in the northern part of this ACZ. There are, generally, three aquifer units in the depth ranges of 67 - 100 m, 150 - 200 m and 240 - 280 m. The discharge of the wells in Lathi aquifer ranges from 6.17 to 19.29 lps for a drawdown range of 2 to 12 m.

Vindhyan Sandstone

Nagaur sandstone is red-buff to pink, medium to coarse grained, hard and compact. It is thinly bedded with intercalations of shale and clay, and with lenticular bodies of anhydrite and gypsum. Nagaur Sandstone is found in the northern part of the Jodhpur district and forms a good aquifer.

Jodhpur litho-unit is classified into Sonia and Girbar sandstone. Sonia sandstone includes boulder beds which unconformably overlie the weathered surface of Malani igneous suits. Girbar sandstone is made up of yellow and purple sandstone inter-bedded with shale, clay, silt-stone and flute casts. Sandstone is red to pink or buff coloured, very hard and compact, at places micaceous, showing ripple marks and current bedding.

The groundwater-bearing formation is of high potential, occurring in Osian, Phalodi, Shergarh, Balesar and Mandore blocks of Jodhpur district. The maximum tapped thickness of aquifer is 300 m in the western part of Jodhpur district.

Groundwater in Jodhpur and Nagaur sandstone occurs under unconfined to semi-confined conditions. The yield of dug wells is low to moderate, varying from 0.10 to 0.58 lps, whereas yield of tube-wells ranges from 0.54 to 4.24 lps with a drawdown of 5 to 8 m.

Bilara Limestone

The limestone in this area is dolomitic and shows considerable lateral and vertical variations. It consists of Dhanapsa dolomite, Gotan limestone and Pundloo dolomite, in the order of superposition. The Dhanapsa dolomite includes cherty dolomite and siliceous-dolomitic limestone with cherty beds. The limestone occupies extensive areas in Phalodi, Osian and Bap blocks and forms an aquifer of high potentiality.

The thickness of limestone ranges from few meters to more than 100 m. The discharge of dug wells, in general, varies between 0.12 and 0.48 lps. In Borunda - Bilara area, the discharge of tube wells is quite high because of the cavernous nature of the limestone. The yield ranges from 0.26 to 5.79 lps with a drawdown of 3 -16 m.

Granites

The granitic hydrogeological unit in this agroclimatic zone comprises granites of Jalore, Siwana and Erinpura Groups as well as Rhyolites of Malani suits of igneous rocks. Groundwater occurs in the weathered and fractured zone of rock formations.

Rhyolite

Rhyolites are dark brown to pink in colour, contain phenocrysts of quartz and feldspar in glassy matrix. Volcanic ash, tuff and breccia have also been reported in association with the rhyolites.

Jalore, Siwana and Erinpura granites are white to pink in colour, fine to coarse grained, having phenocrysts of feldspars.

Groundwater occurs under phreatic conditions mainly in joints, fractures and weathered zones of rocks. However, the units are poorly fractured and jointed, and the intensity of the fracturing decreases with depth thus limiting the groundwater potential of aquifer units. The yield of the wells ranges from 0.05 to 0.58 lps.

1.4 Main Aquifers Units

The different aquifer units of ACZ I(a) and area occupied by these is shown in Table 1.4-1.

Table 1.4-1 Main Aquifer Units of ACZ I (a)

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 1 of Annex 2(b).

From the Table No. 1.5-1 it may be observed that explored depth of older alluvium aquifer unit of ACZ Ia ranges from 21m (Village Lunawas, block Luni, district Jodhpur) to 342m (Village Adel, block Sindhari, district Barmer); the SWL (bgl) from 4.36m (Villgae Ghantaghar, block Mandor, district Jodhpur) to 72m (Village Mitha ka Tala, block Chohtan, district Barmer) and well discharge from 0.14 lps (Village Aau, block Balesar, district Barmer) to 20 lps (Village Katarla, block Dhorimanna, district Barmer).

The aquifer depth for Younger alluvium of the ACZ ranges from 50.75m (Village Partu, block Balotra, district Barmer) to 351.40m (Village Bhedana, block Dhorimanna, district Barmer); the SWL (bgl) from 2.79m (Village Bhedana, block Dhorimanna district Barmer) to 74.85m (Village Ghatour, block Bap, district Jodhpur) and well discharge from 1 lps (Village and block Balotra, district. Barmer) to 36.67 lps (Village Berigaon, block Dhorimanna, district. Barmer)

In Sedimentary aquifer explored depth ranges from 37m (Village Bhaolo, block Mandor, district Jodhpur) to 504.34m (Village Bhiyar, block Sheo, district. Barmer); the SWL (bgl) from 1.40m (Village Bhaolo, block Mandor, district Jodhpur) to 110.95m (Village Dosai, block Sheo, district. Barmer) and well discharge from 1.10 lps (Village Ghantiala, block Balesar, district. Jodhpur) to 40 lps (Village Manchitia, block Bap, district Jodhpur).

The explored depth in hard-rock aquifer ranges from 18m (Village Gagria, block and district Barmer) to 354.10m (Village Giral, block Sheo, district Barmer); the SWL (bgl) from 3m (Village, Koduka, block Sheo, district Barmer) to 180m (Village Bithuja, block Sheo, district. Barmer) and well discharge from 0.08 lps (Village Bisarniya, block Sheo, district Barmer) to 302.40 lps (Village Girab, block Sheo, district Barmer).

1.6 Sub-Surface Hydrogeology

Hydrogeological Cross – section A-A' (Salaria – Aru)

The cross – section A-A' (Figure 1.6-1 and Figure 1.6-2) has been drawn from Aru (Jodhpur District) to Salaria village (Barmer district) in north – east to south – west direction. Total length of the cross – section is 277 Kms. The ground level elevation ranges from RL 89 meters (Kitnoria) to RL 281 meters (Hapasar) above mean sea level. The cross – section reveals that south – western part of the ACZ is occupied by Older alluvium of Quaternary age while in north-eastern part, the Jodhpur Sandstone, Bilara Limestone of Marwar Super group and Rhyolite as post-Delhi Intrusives are encountered. The thickness of alluvium in south-western part is more and gradually decreases towards north- eastern side.

The saturated thickness of alluvium varies from 24 meters (Jogsaria) to 52 meters (Kitnoria). The water level ranges from 36 meters (Salaria) to 72 meters (Hapasar) below ground level.

1.7 Depth to Groundwater

The pre-monsoon depth to groundwater level map of ACZ I(a) is at Drawing No. ACZ I(a)-003. In the ACZ, generally the depth of pre-monsoon levels range from 10m to 40m (bgl) in its central part. In north-eastern and south-western part of ACZ, however, the deeper ground levels of 60 and beyond 100m (bgl) exist. The post-monsoon picture of 2010 (Drawing No. ACZ I(a)-004) practically exhibits no change in levels in relation to pre-monsoon situation except for small part in Luni block of Jodhpur district in the eastern part of ACZ.

1.8 Groundwater Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ I (a) in various aquifer units between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-Wise/Aquifer-Wise Fluctuation in Levels of Groundwater- ACZ I(a)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)
Barmer	Balotra	Older Alluvium	20	0.15	6.20	2.21

ACZ Summary			**345**	**-6.28**	**10.70**	**1.46**

Source: - CGWB and RGWD

From the Table it can be seen that average ground water level fluctuation in older alluvium in the ACZ ranges from 0.05m in Baytoo block of Barmer district to 3.24 m in Mandor block of Jodhpur district. The average fluctuation in sedimentary aquifers in the ACZ ranges from – 0.55m (Vindhyan sandstone) in Bawari block of Jodhpur district to 2.28m (Bilara limestone) in Phalodi block of Jodhpur district. The average ground water level fluctuation in hard rock aquifer ranges from 1.28 m (Jalore Granite) in Bawri block of Jodhpur district to 4.36 m (Rhyolite) in Balotra block of Barmer district.

1.9 Groundwater Levels and Flow Directions

ACZ Ia constitutes parts of two very wide basins, the Luni River Basin, the major part and the Outside Basin, in the north and west. The only surface water channel in the ACZ area is the northern branch of the Luni River, flowing south-westwards, towards the Rann of Kutchh, in Gujarat.

The ground water level contours presented in (Map ACZ Ia-002). The contours within the Luni part of the map seem to converge towards and along the Luni channel whereas within the Outside Basin area the contours indicate a groundwater flow to the north, towards the main extension of the basin and to the west, towards the Rann of Kutchh, Gujarat. In both basins the hydraulic gradients, as demonstrated in the contour map (Map ACZ Ia-002), are remarkably moderate, about 1 – 2 m per 1 km, an outline that may display high transmissivity values/thick aquifers, and/or rather poor replenishment. It seems that both may stand to reason.

The operative aquifers in both of the basins are almost generally similar – Older Alluvium, Vindhyan and Tertiary Sandstones and Jalore Granite. Jurassic Sandstone, Rhyolite and Erinpura Granite in Luni basin and Bilara Limestone in the Outside Basin part. Younger Alluvium is encountered along some stretches of the Luni River(Map ACZ Ia-002). On a regional level, it seems that these aquifers are far better (see above), in terms of hydraulic properties, than in other basins of Rajasthan, and their thickness may quite as well maintain highly productive tube wells.

Depth to water level varies from 20 – 40 m BGL in the major part of the Luni component of the ACZ and the Phalodi and Bap blocks of the Outside Basin area, to 100 m BGL and over in the west, in the Barmer and Sheo blocks (Map ACZ Ia-003). It is the deepest reported water level in Rajasthan. This water level condition is not possible in the water bearing formations (excluding the alluvial ones) east of the Aravali, characterized by much lower properties and much thinner operative profile.

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ I(a) are shown in Figure 1.10-1 to 1.10-15. The supportive data for the same is given in Annex 9.

1.10.1 Jodhpur District

The pre-monsoon average ground water level in Jodhpur district in 1984 vary between a minimum of 133.95 m amsl (Bap block) to a maximum of 241.09 m amsl (Bawari block) while in the year 2010 the pre-monsoon average ground water level in this district range from a minimum of 132.66 m amsl (Bap block) to a maximum of 222.19 m amsl (Bawari block). Long-term groundwater levels in each block presented in Figure 1.10-1 to Figure 1.10-8. Water table stages in all blocks exhibit declining trends that reflects over-exploitation of groundwater above the natural replenishment (dynamic resource) in each block and in the entire district. The blocks can be classified into 3 main groups according to the severity of the water table decline (based on average pre monsoon rates):

Close to stable: Bap and Luni Blocks

These two blocks present very low decline rates of < -0.1 m/yr featuring almost stable levels in the past 3 decades. As rainfall is almost similar throughout the district, this can be directly linked to the relatively low groundwater withdrawals in these blocks, standing at only 22 Mm^3 each (2009, see Table 1.11-3).

Moderate decline: Shergarh, Phalodi, Mandor, Balesar and Osian Blocks

Groundwater decline rates in these 5 blocks range between -0.18 m/yr and -0.41 m/yr (Pre-Monsoon Average rates; Table 1.10-1). Both pre and post stages present similar trends and similar long-term decline rates. Groundwater draft in these blocks vary between 45-70 Mm^3 with very significant increases during the period 1995-2009 of over 100% in each block. Outstanding is Osian Block with an extremely high annual draft. Drafts in this block increased dramatically between 2004 and 2007 reaching almost 200 Mm^3 (see Table 1.11-3). The effect of the high absolute abstraction volumes is clearly visible in the water table trend, which demonstrates a sharp fall between year 2006 and year 2007 measurements, of over 5m (Figure 1.10-6).

Significant Decline: Bawari Block

Bawari Block presents the highest water table decline rate in the ACZ reaching -0.78 m/yr for both seasons (Table 1.10-1). Groundwater drafts in this block are the second highest in the district after Osian and obviously much above the safe yield (Figure 1.11-4). However, the severity of water table decline suggests that this block is also affected by the intensive abstraction in the neighbouring blocks. Groundwater

abstractions in Bhopalgarh block to the east (ACZ IIa) have exceeded 150 Mm^3/yr while Osian block to the west is featuring the highest rates in the entire ACZ Ia (177 Mm^3 in 2009; Figures 8.7 & 8.8). The proximity to the hydrogeological divide between the Luni and Outside Basins might also be an exacerbating factor.

The above classification is based on the average rates during pre-monsoon stages. It should be noted that at some locations in the ACZ, positive rates indicating rising groundwater levels were recorded, both in pre and post monsoon periods. Maximum rising rates have been recorded in Bap Block, reaching +0.82 m/yr while in Bawari block an insignificant maximum rise of +0.07 m/yr was recorded. These figures relate well to the average rates mentioned above, where Bap block presented the lowest declining rate and Bawari block recorded the highest water table declining rate. Maximum rates represent the locations with the most severe conditions of water table decline. Rates of over -1 m/yr were recorded in Bawari (-1.5 m/y), Mandor (-1.08 m/y) and Osian (-1.7 m/y) blocks (Table 1.10-1).

Generally, post monsoon levels are higher than pre monsoon stages in all blocks; accept for certain years (different at each block) in which low rainfall and abstraction pattern resulted higher pre monsoon levels. The difference between pre and post stages is low in most blocks varying around 1 m. This might be attributed to the relatively high transmissivities of the Bhander Sandstone and uniform abstraction throughout the entire year. Correlation to rainfall is relatively weak suggesting that the dominant factor effecting groundwater levels are the drafts (Figures 1.10-1 – 1.10-8). However, the effect of rainfall on groundwater stages can still be noted in years of high precipitation, For example 2003 in Osian and Mandor blocks, 2001 in Phalodi block, 1996-1998 in Luni block, etc.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, if no actions are taken, the most severe scenario is expected in Bawari block where average groundwater levels are predicted to reach 183 m amsl by the year 2060, 39 m below current stages. As a result, 92% of the monitoring wells (CGWB & RGWD) in the block will dry up. Continuation of current practices of groundwater exploitation will result harsh outcomes in all blocks, where the number of dry monitoring wells (CGWB & RGWD) is expected to increase between 2 times (Shergarh block) and 10 times (Luni block).

1.10.2 Barmer District

In the year 1984 the pre-monsoon average ground water level in Barmer district vary between a minimum of 57.68 m amsl (Dhorimanna block) to a maximum of 166.09 m amsl (Barmer block) while in the year 2010 the pre-monsoon average ground water level in this district range from 53.20 m amsl (Dhorimanna block) to a maximum of 166.87 m amsl (Barmer block). Water table stages in most areas exhibit mild changing trends in the range of +0.06 to -0.21 m/yr (Pre-monsoon; Table 1.10-1). The average rates present a rather reasonable status of groundwater resources, compared to Jodhpur district and other districts outside this ACZ. The relatively low declining rates can be attributed largely to the low groundwater abstractions and

more importantly to the relative stability in the drafts since 1995 (Figures 1.11-1 – 1.11-3 and Table 1.11-3).

Minimum rates, representing rising water levels vary between +0.77 m/yr to +0.01 m/yr. Maximum declining rates of the water table were recorded in Balotra Block and reach -1.95 m/yr and -2.36 Pre and Post-Monsoon respectively (Table 1.10-1). Pre and post monsoon patterns in this district are highly similar and present almost the same stages and same rates.

Water table fluctuation in most of the blocks is almost absent (Figure 8.4). In general, correlation to rainfall can be hardly identified due to the low fluctuation, but is recorded in few cases during years of exceptional rainfall such as 1990 and 2006 (Figures 1.10-9 – 1.10-15).

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-4). Accordingly, groundwater levels in Sindhari block are expected to decline by ~10 m until 2060 (a relatively minor drop for the period of 50 years). However, as a result, the percentage of dry monitoring wells (CGWB & RGWD) in the district during pre-monsoon will increase from 34% to 55%. Figures of predicted dry monitoring wells (CGWB & RGWD) during the post-monsoon are highly similar. By the year 2040, the number of dry monitoring wells will grow excessively and will vary from 35% in Sheo block to a maximum of 65% in Sindhari block.

1.11 Long-Term Drafts

The total draft in ACZ Ia increased from 436 Mm^3 during 1995 to 744 Mm^3 during 2009 – a relative rise of 70% (Figure 1.11-1). The main abstraction of groundwater during 2009 was in Jodhpur District with 517 Mm^3 (~0.021 Mm^3/km^2) compared to 227 Mm^3 in Barmer district (~0.008 Mm^3/km^2; see Figure 1.11-1, Table 1.11-3). Most of the exploitation of groundwater in the ACZ is for irrigation – during 2009 595 Mm^3 (80%) were consumed for irrigation while 149 Mm^3 (20%) for domestic and industrial uses (Source: CGWB and RGWD Figure 1.11-2). However, the fraction of domestic and industrial usage in ACZ Ia is relatively high compared to the rest of Rajasthan (3-10%).

Figure 1.11-1 Total Groundwater Draft for all uses in ACZ Ia by Districts (1995-2009)

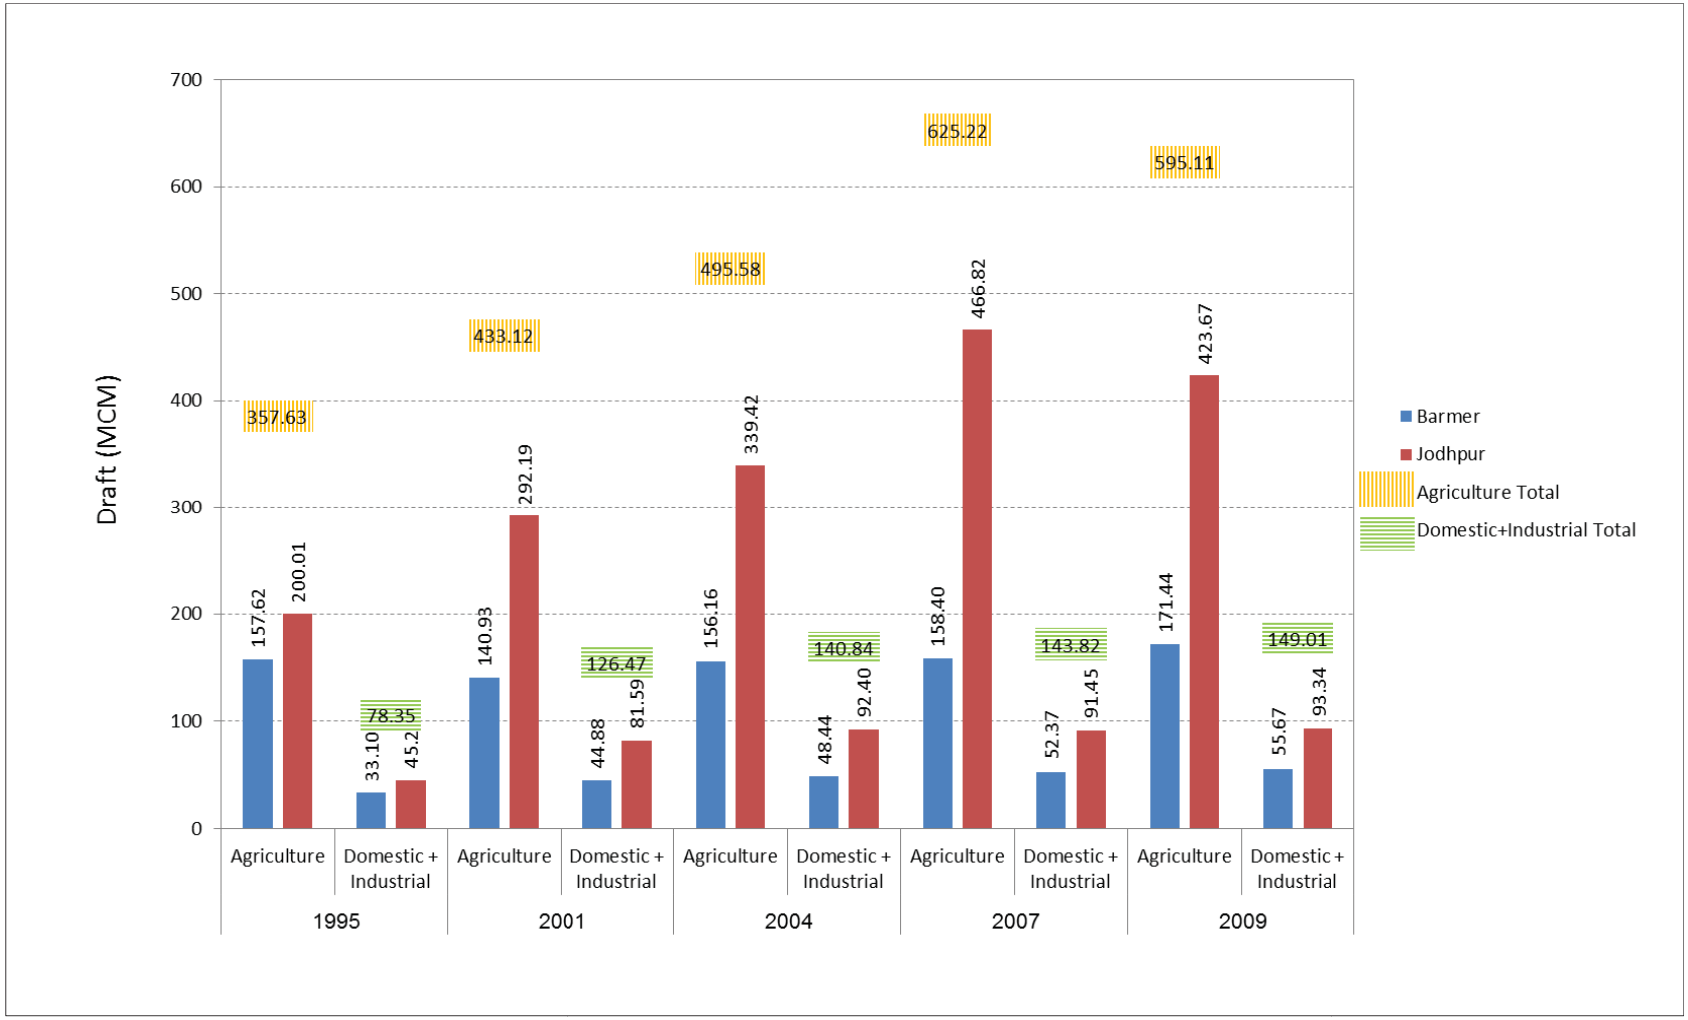
Figure 1.11-2 Groundwater Draft for Agriculture and Other Users in ACZ Ia by Districts



Source: CGWB and RGWD

1.11.1 Barmer District

Groundwater abstraction in this district during 2009 reached 227 Mm^3 which comprises ~32% out of the total draft in the ACZ. The draft increased from 191 Mm^3 during 1995 to 227 Mm^3 during 2009 – a relative growth of ~19%. Dhorimanna Block presents the highest drafts in particular for agricultural purposes, whereas Baytoo and Barmer Blocks show the lowest drafts (particularly low agricultural drafts) with a high fraction for domestic & industrial out of the total draft (Figure 1.11-3, Table 1.11-3). Although the absolute change of drafts does not seem so high, the relative change in Baytoo, Barmer and Sindhari blocks is significant. Nevertheless, the total drafts in Barmer District are relatively constant throughout the examined period (Figure 1.11-3). Sheo block displays a dramatic decrease in groundwater draft from 69 Mm^3 in 1995 to 18 Mm^3 in 2001, a relative decline of 74%. On the other hand, during the same years, drafts in Sindhari block increased from 9 Mm^3 to 30 Mm^3, a rise of 230% (Figure 1.11-3, Table 1.11-3). The overall change in the total draft in the district between 1995 and 2001 was negligible.

Table 1.11-1 Total Change in Groundwater Draft – Barmer District (within ACZ Ia) 1995-2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change	Remarks
Baytoo	> +500%	+77%	+137%	During 1995 there was almost no agricultural draft
Balotra	-27%	+44%	-19%	
Barmer	+297%	+120%	+172%	
Chohtan	+84%	+162%	+95%	
Dhorimanna	+42%	+90%	+46%	
Sindhari	> +500%	-56%	+329%	During 1995 there was almost no agricultural draft
Sheo	-80%	+213%	-60%	
District Total	**+9%**	**+68%**	**+19%**

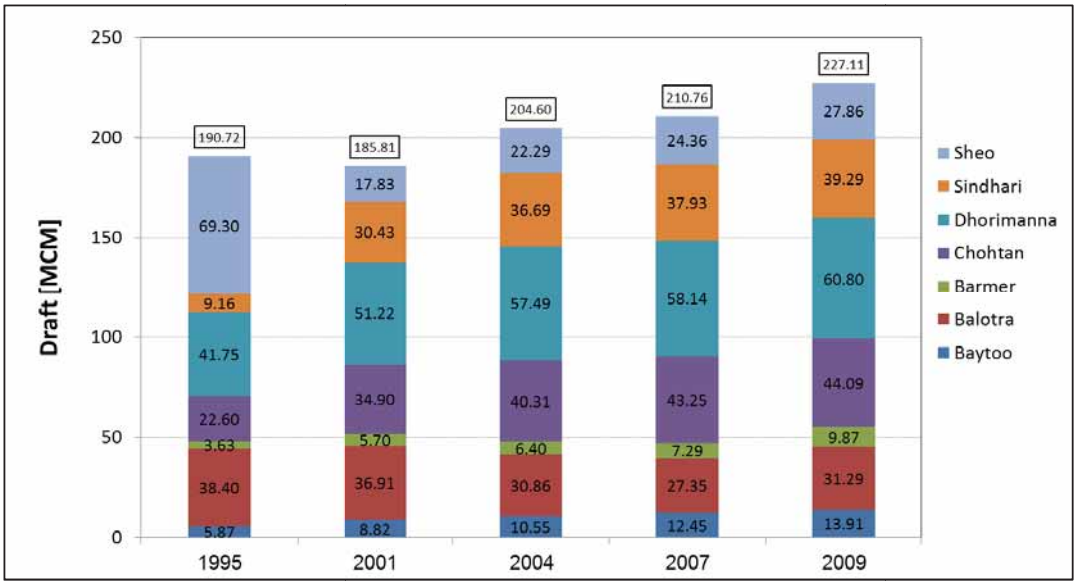
Figure 1.11-3 Total Groundwater Abstraction in Barmer District (within ACZ Ia) by Blocks



Source: CGWB and RGWD

1.11.2 Jodhpur District

The groundwater draft in this district during 2007 reached 558 Mm^3 comprising ~68% out of the total draft in the ACZ. The draft increased from 245 Mm^3 during 1995 to 558 Mm^3 during 2007 – a relative rise of ~127%. Osian Block displays the highest volumes reaching a maximum of 195 Mm^3 during 2007 which consisted ~35% out of the total draft in the district at that year (Figure 1.11-4, Table 1.11-3). Osian block drafts are used mainly for agricultural purposes; nevertheless its domestic and industrial drafts are also the highest in the district (~27% out of the total; Table 1.11-3).

Although the absolute change of draft volumes does not seem very high, the relative change in Balesar, Bap, Luni, Mandor, Phalodi and Shergarh Blocks is dramatic (Figure 1.11-4, Table 1.11-3). The total draft in Jodhpur District grows with a relative constant rate from 1995 to 2007, whereas a minor drop recorded between 2007 and 2009 (Figure 1.11-4).

Table 1.11-2 Total Change in Groundwater Draft - Jodhpur District 1995 - 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change	Remarks
Balesar	+245%	+175%	+231%	
Bap	> +500%	+298%	> +500%	During 1995 there was almost no agricultural draft
Bawari	+52%	+46%	+51%	
Luni	+203%	+224%	+207%	
Mandor	+170%	+231%	+181%	
Osian	+52%	+46%	+51%	
Phalodi	> +500%	+121%	+362%	During 1995 there was almost no agricultural draft
Shergarh	+302%	+143%	+260%	
District Total	+112%	+106%	+111%

1.12 Groundwater Quality

1.12.1 Groundwater Quality – Village/Block-Wise

Out of total number of 2,713 villages in ACZ I(a), 303 are found suitable for drinking water use, 407 for irrigation use and 1,811 for livestock water use.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in groundwater is summarised in Table 1.12-1.

The details of village-wise assessment of ground water quality is shown in Annex 4.

Table 1.12-1 Village and Block-Wise Water Quality

ACZ	District	Block	Total Number of Villages	Electrical Conductivity, µS/cm			Chloride, mg/l			Fluoride, mg/l			Nitrate, mg/l		
				Highest Desirable Limit: 750	Maximum Permissible Limit: 2,250	Above Maximum Permissible Limit: 2,250	Highest Desirable Limit: 250	Maximum Permissible Limit: 1000	Above Maximum Permissible Limit: 1000	Highest Desirable Limit: 1.0	Maximum Permissible Limit: 1.5	Above Maximum Permissible Limit: 1.5	Highest Desirable Limit: 45	Maximum Permissible Limit: 100	Above Maximum Permissible Limit: 100

Source: - CGWB and RGWD

It may be seen from above that out of 2713 villages of ACZ Ia, 127 fall under desirable, 1431 under maximum permissible limit and 1155 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 359 while number of villages with maximum permissible limit of use is 566 and number of above maximum permissible limit for Fluoride is 1788. As regards presence of nitrate in ground water, 256 fall under highest desirable limit of less than 45 mg/l and 556 under maximum permissible limit along with 1901 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 379 villages fall under maximum permissible limit and 2306 under above maximum permissible limit of 2250 microhos/cm and 28 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

Groundwater Quality of ACZ I(a) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ I(a) is shown in Drawing No. ACZ I (a)-005. It may be seen from the map that large part of ACZ occupied with different aquifers is infested with concentration of chloride of 250-1000 mg/l. Groundwater of potable quality with chloride level of less than 250 mg/l occurs in isolated pockets in Older alluvium, sandstone and limestone aquifer units. A few large area of potable groundwater quality occurs in Sandstone aquifer in Balesar block and Younger alluvium of Bap block of Jodhpur district. High levels of chloride (1000 mg/l) occur in Alluvium, Sandstone and Granite rock aquifer units of Mandor and Shergarh blocks of Jodhpur district and in Baytoo, Sindari, Barmer and Dhorimanna blocks of Barmer district.

Block-wise/aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in Table 1.12-2.

Table 1.12-2 Percent Area occupied with Various Level of Chloride in Groundwater of ACZ I (a)

District	Block	Hydrogeological Unit	Percent area occupied with various level of Chloride, mg/l

Source: - CGWB and RGWD

From table, it may be seen that only 2% area in Barmer district and 11% in Jodhpur district bear fresh groundwater where chloride concentrations in groundwater within potable limit of 250 mg/l. The remaining area of ACZ I(a) is occupied with poor quality groundwater with concentrations exceeding drinking water standards. About 83% area of older alluvium, 100% area of Tertiary sandstone aquifer and 99% area of Rhyolite aquifer and 100% area of Jalore Granite in Balotra block of Barmer district bear high concentration of chloride in groundwater in the range of 250-1000 mg/l and beyond 1000 mg/l. In Jodhpur district, 83% area of Vindhyan sandstone unit and 100% area of Bilara limestone in Bawari block of Jodhpur district bear undrinkable quality of groundwater with chloride levels exceeding 250 mg/l. All the aquifer units of Osian block of Jodhpur district constitute 73 to 100% areas which bear higher concentration of chloride beyond potable limit of 250 mg/l.

Groundwater Quality of ACZ I (a) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ I(a) is shown in Drawing No. ACZ I(a)-006. It may be seen that a large area of the northern part of the ACZ occupied with limestone and sandstone rock units in Jodhpur district and in western part of ACZ occupied by Barmer district possess low nitrate level groundwater with concentrations falling within permissible and desirable limit of water use for drinking purposes. A large part of ACZ is its central and southern part occupied with alluvium and sandstone aquifer units bear poor quality groundwater with nitrate levels of about 100 mg/l.

Block-wise/aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

ACZ Ia Summary			**14.85**	**28.33**	**56.82**

Source: CGWB and RGWD

From the above table, it may be seen that about 92 % area of Barmer district is covered with high-level nitrate-rich groundwater. A large part of Jurassic sandstone aquifer in Barmer block of the district is potable quality water but the same sandstone in Baytoo block of the district entirely constitutes high nitrate level groundwater with concentration reaching beyond 45 mg/l.

As far as Jodhpur district is concerned, it constitutes 24.69% area as potable groundwater in relation to nitrate content of groundwater. The Jalore granite in Luni

and Mandor blocks is entirely occupied with higher concentration of nitrate beyond limits of water use for drinking purpose.

Groundwater Quality of ACZ I (a) by Fluoride

Distribution of Fluoride in ground water (Pre- monsoon 2010) of ACZ Ia is shown in Drawing no. ACZ Ia-007.

It may be seen from the map that non-potable ground water with Fluoride level of >1.5 mg/l occur in large parts of the ACZ covering Jodhpur and Barmer districts. Potable quality with fluoride concentration of less than 1.5 mg/l occur in isolated pockets of land occupied by Alluvium, Rhyolite and Bilara limestone aquifer units in northern, south, south-western and eastern parts of the ACZ.

The percent area occupied by various levels of Fluoride in aquifer units of the ACZ given in Table 1.12-4.
Block-wise/aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

ACZ Ia Summary			**14.24**	**25.60**	**60.16**

Source: - CGWB and RGWD

It may be seen from the Table that only 39.84% area of the ACZ is potable with fluoride content of ground water being <1.5 mg/l. The 100% area with >1.5 mg/l of Fluoride content pertain to Tertiary Sandstone in Balotra block; Jurassic Sandstone aquifer unit in Barmer block of Barmer district; Rhyolite aquifer unit in Balesar block, Bilara Limestone aquifer unit in Bawri block, Phyllite/ Schist aquifer unit in Luni block of Jodhpur district. Overall, more than 60% area of the ACZ in infested with higher concentration of fluoride of the range more than 1.5 mg/l.

Groundwater Quality of ACZ I(a) by EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ I(a) is shown in Drawing No. ACZ I(a)-008.

It may be seen from map that the low to medium salinity level groundwater occurs in northern and central part of the ACZ in parts of Jodhpur and Barmer district occupied with Bilara Limestone, Tertiary sandstone, Jurassic sandstone and Vindhyan sandstone units. The southern and western part of the ACZ in Luni and Mandor blocks of Jodhpur district and Balotra, Sindhari, Baytoo, Chohtan and Dhorimanna blocks of Barmer district comprise high to very high salinity groundwater with EC concentrations of 5000 and beyond 5000 micromhos/cm.

Block-wise / aquifer-wise percent area occupied with various levels of EC in groundwater of ACZ is shown in Table 1.12-5.

Table 1.12-5 Percent Area occupied with Various Level of EC in Groundwater of ACZ I (a)

Source: - CGWB and RGWD

From the above table, it is seen that 100% area of Jurassic sandstone in Barmer block of Barmer district and 72% of Older alluvium in Chohtan and Dhorimanna blocks of Barmer district bear EC concentration in groundwater in the range of 2,250-5,000 micromhos/cm.100% area of Jalore Granite and Tertiary sandstone aquifer units of Balotra block of Barmer district; Younger alluvium aquifer unit of Sheo block of Barmer district; Rhyolite aquifer unit of Balesar block of Jodhpur district and Jalore granite aquifer unit of Luni block of Jodhpur district comprise very high salinity ground water with EC concentration of beyond 5000 micromhos/cm.

1.12.3 Long-Term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ I(a) are shown in Figure 1.12-1 to 1.12-30. The supportive data for the same is given in Annex 10.

Barmer District

Average chloride and EC concentrations per block for the period 1984-2009 are presented in Figures 1.12-1 to Figures 1.12-13 (odd figures). The graphs demonstrate well the high correlation between the two parameters. The long-term trends of average chlorides in most blocks during most of the period fluctuate within the range of 1,000 to 1,500 mg/l, higher than the maximum accepted for drinking (1,000 mg/l). However, average concentrations vary between a minimum of ~600 mg/l in Chohtan

block to a maximum of 2,000 mg/l in Sindhari block. In fact, Chohtan block is the only one where average values are within permissible limits for drinking. Chohtan Block displays a moderate drop from ~950 mg/l to ~600 mg/l with an average value of 700 mg/l. Sindhari Block presents the highest concentration in Barmer District with a moderate rise from an ~750 mg/l (1984) to ~1,500 mg/l (2009). However, during most of the years, Cl levels were >1,500 mg/l. Although significant seasonal and annual fluctuation is evident, most of the blocks retain relative stable levels in the long-term. This observation might be linked to the very low declining rates of groundwater levels presenting close to stable conditions (ch. 8.10). Two exceptions include: (a) Baytoo block which presents an unexplainable declining trend from ~2,000 mg/l in the 80's to ~1,000 in 2009 (b) Barmer block which presents an increase in Cl levels from ~1,000 in 1985 to ~1,300 mg/l in 2009. Seasonal fluctuation is also demonstrated, reflecting the positive effect of the monsoon rains, by lowering groundwater salinities.

EC trends follow very closely the chloride trends mentioned above. Average EC levels in the district are usually between 4,000 and 7,000 μS/cm; much higher than the permissible limit for irrigation. Minimum concentrations were recorded in Chohtan block (2,500 to 4,000 μS/cm) while maximum (average) concentrations are observed, similarly to Cl, in Sindhari block, reaching as high as 9,000 μS/cm. In general, EC trends are stable in the long-term in most blocks except for two cases. In Baytoo block, levels decreased from ~7,000 μS/cm (1984) to 3,500 μS/cm (2009). In Barmer block, EC increase was recorded from ~4,000 μS/cm (1984) to almost 7,000 μS/cm (2009). According to the above, groundwater in general in the ACZ are considered saline and not suitable for irrigation. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ I(a)-009.

Figure 1.12-2 to Figure 1.12-14 (even figures). Average NO_3 concentrations in most blocks are between 200 and 400 mg/l; significantly higher than the permissible limit for drinking (100 mg/l). Peak values were recorded as high as 700 mg/l in Sindhari block (1990-1994) and 550 mg/l in Barmer block (1992-1994). These observations reflect contamination events occurring most probably at a substantial part of the block which caused a temporal increase in the average concentrations of the entire block.

Fluoride concentrations are presented in Figure 1.12-2 to Figure 1.12-14 along with the nitrates. Concentrations have high heterogeneity in space and time. In general, concentrations in the district fluctuate between 1-3 mg/l. In most blocks, most of the time, F levels are higher than the permissible limit for drinking (1.5 mg/l). Barmer and Chohtan blocks present the lowest average levels in the district, which reach as low as 0.5 mg/l and stand most of the time within the permissible limit. Dhorimanna block displays especially high values, reaching almost 5 mg/l in 2009. Few blocks including Dhorimanna, Barmer, Baytoo, Chohtan and Balotra exhibit a rising trend in average concentration during the last few years (since 2007). These trends should be closely monitored in the next years in order to be able to understand weather these are continuing or rather local fluctuations in time.

Jodhpur District

Jodhpur District presents a significantly better quality of groundwater than Barmer District. The district is spread over two river basins: Luni in the south and Outside Basin in the north. In Luni River Basin groundwater flow direction is south-westwards while in the Outside Basin section, flow direction is to the north. There is a negative correlation between groundwater concentrations and the depth to groundwater. Luni block has the highest ions concentrations and the depth to groundwater is relatively small (mostly 2-10 m), whereas Osian and Phalodi Blocks display the lowest concentrations and relatively high depth to groundwater (40-120 m).

Average chloride (Cl) concentrations and electrical conductivity (EC) in groundwater during 1984-2009 are presented per block in Figure 1.12-15 to Figure 1.12-29 (odd figures). All blocks present relatively high correlation between Cl and EC. The southern blocks (Shergarh, Luni and Mandor) present higher Cl concentrations than the northern blocks (except of Bap).These southern blocks have similar conditions to those presented in Barmer District. During most of the afore mentioned time period the Cl concentration in the southern blocks (including Bap Block) ranged between 800 and 1,400 mg/l (mostly higher than the maximum allowed for drinking – 1,000 mg/l), whereas in the central blocks it ranged between 200 and 600 mg/l (within permissible limits for drinking water).Luni Block presents highest Cl concentrations in Jodhpur District with a range between 900 and 1,400 mg/l and relatively high oscillations, these concentrations spread over most of the block during most of the time period. Osian Block presents the lowest concentrations in Jodhpur District with a range between 200 and 400 mg/l, these concentrations spread over all of its area during most of the period. All blocks show seasonal fluctuations that may reflect the influence of monsoon rains on Cl content, nevertheless most of the blocks retain relatively stable long-term conditions. Mandor is the only block that presents a significant change (rise) of Cl concentration from ~600 mg/l in mid-80's to ~1,400 mg/l in 2009, probably due to its significantly higher population density (600-900 people/km^2) compared to all other blocks in ACZ Ia (140-250 people/km^2).

EC long trend is highly correlative to Cl trends mentioned above. Average EC levels in the district usually vary within the range 1,000 and 10,000 µS/cm, whereas during most of the time and in most of the blocks it is much higher than the permissible limit for drinking and irrigation water. Similar to the Cl record, minimum concentrations are found in Osian Block (1,000 to 2,000 µS/cm),and maximum concentrations are found in Luni Block (6,000 to 10,000 µS/cm).In most blocks the EC values are satisfying for agriculture purposes and its spatial distribution seems to be relatively unchanged.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figure 1.12-16 to Figure 1.12-30 (even figures). During most of the time, the average concentrations are between 50 and 300 mg/l and in most of the blocks it is above the permissible limit for drinking water. Osian Block had the lowest concentrations (50-100 mg/l). Osian and Phalodi are the only two blocks with permissible concentrations for drinking water during most of the aforementioned period. Shergarh Block presents the highest concentrations throughout the aforementioned time period (150-300 mg/l). While observing the spatial long-term distribution of NO_3, a relatively small plume is found in Mandor Block, and Jodhpur city which is

probably caused due to domestic and industrial uses and sources of pollutions combined with a lower depth to groundwater in this area compared to its surrounding (20-40 m in a surrounding of 40-100 m depth).

Fluoride concentrations are generally between 1 and 5 mg/l in the district, whereas during most of the time in most of the blocks the concentrations are above the permissible limit for drinking water. The lowest concentrations are presented in Osian and Phalodi Blocks (1-2 mg/l). Highest concentrations are found in Mandor Block (2.5-5 mg/l). It seems that there is some positive spatial correlation between NO_3 and F concentrations, in particular in Mandor Block next to Jodhpur City where there are two plumes of high concentrations of both ions. These plumes might be caused by the domestic and industrial water use in Jodhpur City.

		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium

The salinity hazard status and sodium hazard status of various aquifer units is described in the table given above. In Bilara limestone, 7 classes of ground water could be deciphered. They range from medium salinity and low sodium class to very high salinity and very high sodium class. Almost similar water quality status also exists in Jalore Granite Jurassic Sandstone, Rhyolite, Tertiary sandstone and younger alluvium aquifer units of the ACZ.

A map on classification of irrigation water of the ACZ is prepared for the ACZ (Drawing no. ACZ Ia- 009). A view of the map depicts that excellent to good quality irrigation water (C_2S_1 to C_3S_4) occur in northern part of the ACZ around Jodhpur and in eastern part of the ACZ in Mandor, Osian and Balesar blocks, As can be seen from the map, most of the area bears bad quality ground water not suitable for crops excepting isolated pockets around Shergarh, Jodhpur, Phalodi and western and southern parts of the ACZ. The most part of the ACZ comprise high salinity and high sodium water class, generally not suitable for irrigation crops.

1.14 Groundwater Draft Village-Wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ I(a). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Groundwater Abstractions (2010) in ACZ I(a)

ACZ Ia Total			664.59	99.38	763.97

Source: - Village wise Data of Tehsil, CGWB and RGWD

It may be observed from the above Table that total abstraction for all uses in ACZ Ia is 763.97 Mm^3, which include 664.59 Mm^3 as gross agriculture draft and 99.38 Mm^3 as gross domestic and industrial draft.

A total of 225.05 Mm^3 are abstracted from Barmer district part of the ACZ which include 180.61 Mm^3 as agriculture draft and 44.44 Mm^3 as domestic & Industrial. A maximum abstraction has taken place in Dhorimanna block, which amount to 67.20 Mm^3 and minimum 16.98 Mm^3 abstractions have occurred in Baytoo block. Among aquifer units, maximum abstraction of 46.88 Mm^3 is obtained from older alluvium unit in Chohtan block of Barmer district.

In Jodhpur Part of the ACZ total 538.92 Mm^3 of ground water is abstracted which include 483.98 Mm^3 as agriculture draft and 59.94 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Osian block, which amount to 204.11 Mm^3 and minimum 15.26 Mm^3 abstraction have occurred in Luni block. Among aquifer units, maximum abstraction of 185.87 Mm^3 are obtained from Vindhyan sandstone units in Osian block of Jodhpur district.

1.15 Static Groundwater Resources

1.15.1 Static Groundwater Resource (Fresh Groundwater)

The Fresh static groundwater resources of ACZ I(a) for year 2010 are presented in Table 1.15-1.

District Total			**2,968.51**
ACZ Ia Total			**7,413.16**

Source: - CGWB and RGWD
Note: Zero availability means negligible value

Of the total assessed 7413.16 Mm^3 fresh static groundwater resources for the ACZ about 4444.65 Mm^3 are present in Barmer district & remaining 2968.51 Mm^3 in Jodhpur district. The maximum in-storage of groundwater of 1232.13 Mm^3 is present in Dhorimanna block of Barmer district. Among aquifer units of ACZ, the Older alluvium unit in Chohtan block of Barmer district comprises 1014.86 Mm^3 of static groundwater resource. It is also worth monitoring that Vindhyan sandstone unit alone constitute 1720.09 Mm^3 static groundwater resources in the ACZ.

1.15.2 Static Groundwater Resources (Saline Groundwater)

The saline static groundwater resources of ACZ I(a) for year 2010 are presented in Table 1.15-2.

District Total			**491.36**
ACZ Ia Total			**3,596.72**

Source: - CGWB and RGWD
Note: - Zero availability means negligible value

Of the assessed static saline groundwater resources of 3,596.72 Mm^3, about 3105.36 Mm^3 occur in Barmer district and 491.36 Mm^3 in Jodhpur district of the ACZ.

Among the blocks, the Balotra block of Barmer district constitute a total maximum of 916.15 Mm^3 of static resource mostly contained is Older alluvium aquifer unit of the block. Older alluvium aquifer unit is having maximum static resources of 2053.04 Mm^3 in the ACZ.

1.16 Dynamic Groundwater Resources

1.16.1 Dynamic Groundwater Resource (Fresh Groundwater)

The assessed net availability of dynamic groundwater resource, groundwater abstraction for all type of uses, the stage of groundwater development and category of development block for the year 2010 is shown in Table 1.16-1.

Table 1.16-1 Fresh Dynamic Groundwater Resources (2010) of ACZ I(a)

ACZ Ia Summary			**465.10**	**763.97**	**164.26**	**Over Exploited**

Note: - Zero availability means negligible value

It may be seen from the table that net groundwater availability in the ACZ I (a) is assessed as 465.10 Mm^3 and draft for all types of uses as 763.97 Mm^3. This works out the stage of groundwater development in ACZ I(a) as 164.26 % giving the zone

an Over-Exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ I(a) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ I(a)-010.

Of the total 15 blocks of ACZ I (a), 10 blocks are categorised as Over-Exploited blocks, 2 as Critical, 1 as Semi critical and 2 under Safe category. The stage of ground water development of over-exploited blocks range from 138.39% (Dhorimanna block, district Barmer) to 387.45% (Osian block, district Jodhpur).

1.16.2 Dynamic Groundwater Resource (Saline Groundwater)

The assessed net availability of saline dynamic groundwater resource for the ACZ for year 2010 is shown in Table 1.16-2.

Table 1.16-2 Saline Dynamic Groundwater Resources (2010) of ACZ I(a)

District	Block	Hydrogeological Unit	Net Groundwater Availability, Mm^3

	Block Total		**7.99**
District Total			**68.69**
ACZ Ia Total			**301.24**

Note: Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 301.24 Mm^3. The net ground water availability in Barmer district part of the ACZ is 232.55 Mm^3 while that of Jodhpur district is 68.69 Mm^3. The maximum net ground water availability is 64.65 Mm^3 in Balotra block of Barmer district.

1.17 Assessment of Groundwater Availability

The net dynamic groundwater availability at year 2010 (fresh water) in ACZ I(a) is 465.10 Mm^3 and groundwater draft 763.97 Mm^3. The stage of groundwater development in zone is 164.26% and is categorised as Over-Exploited zone. Saline dynamic groundwater resource of the zone is assessed at 301.24 Mm^3.

The total static fresh groundwater resource in ACZ is assessed at 7413.16 Mm^3, and saline static groundwater resources as 3596.72 Mm^3.

1. Groundwater Study of Agroclimatic Zone I (b)

1.1 General

The ACZ covers an area of 20,620.77 km^2 and comprises the districts of Ganganagar and Hanumangarh. The average annual rainfall in the zone is 244 mm and mean annual evaporation 194.3 mm.

1.2 Geology

This ACZ mostly comprises Quaternary alluvium which constitutes sand silt, Kankar and gravel deposits. A small part of ACZ in its southern part is occupied with sandstone, interbedded with clay stone and limestone.

1.3 Hydrogeology

Hydrogeology of hydro-strategraphic units as aquifers occurring in ACZ is described in following paragraph. Area occupied by various aquifer units in different blocks and districts of covering ACZ is given in Table 1.4-1. Hydrogeology map of ACZ I (b) is at Drawing No. ACZ I(b)-001.

Alluvium

The alluvium comprises unconsolidated to semi-consolidated sediments including gravel, sand, silt, clay and kankar. It is mostly of fluvial origin, yellow to greyish-brown in colour, medium to fine grained and inter-mixed with kankar. The wind-blown sand is yellowish-brown to buff coloured. It consists of rounded to sub-rounded quartz with minor biotite and magnetite. The sand is covered by Younger and Older alluvium. It has considerable thickness in the northern parts, gradually decreasing towards the south and eastwards. The thickness of the alluvium varies from 100 to 400 m in the northern part of Hanumangarh and Ganganagar district. The yield of open dug wells in Alluvium is around 0.23 lps, whereas that of tube-wells ranges from 0.56 lps to 1.39 lps.

1.4 Main Aquifer Units

The different aquifer units of ACZ I(b) and area occupied by these is shown in Table 1.4-1.

Table1.4-1 Main Aquifer Units of ACZ I(b)

District	Block	Aquifer Units	Area (Km^2)
GANGANAGAR	Anupgarh	Older Alluvium	50.36

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 2 of Annex 2(b).

From the Table no. 1.5-1 it may be observed that explored depth of older alluvium aquifer unit of ACZ Ib is 80m from one well only (Village Malkhana khurd block Suratgarh, district Ganganagar). The SWL (bgl) is 48m and well discharge is 1.89 lps represented by the same well. In Younger alluvium the aquifer depth ranges from 27m (Village Nathewala, block Padampur, district Ganganagar) to 543m (Village and block Anupgarh, district Ganganagar); the SWL (bgl) from 2.95m (Village Rangmahal, block Suratgarh, district Ganganagar) to 49m (Village Chak 81, block Suratgarh, district Ganganagar) and well discharge from 0.34 lps (Village Wasra, block Raisinghnagar, district Ganganagar) to 33.33 lps (Village Baropal, block Pilibanga, district Hanumangarh).

1.6 Sub-surface Hydrogeology

Hydrogeological cross – section A-A' (Bijaynagar-Hanumangarh)

The cross-section A-A' (Figure 1.6-1 and Figure 1.6-2) has been drawn from Bijaynagar in the south western part of the ACZ to Hanumangarh in north-eastern part of the Agroclimatic zone. The total length of the cross- section is 93.5 km. The ground level elevation has a range from RL 161.52 m (Bijaynagar) to RL 177 m (Hanumangarh) above mean sea level. The cross-section reveals that alluvium of Quaternary age is the main formation throughout the cross-sectional area. The cross-section depicts that lenses of fine grained sand are encountered in the north-eastern part and the thickness of the same reduces towards south-western side and finally pinches out near Harsinghpura village. In major part of the cross-sectional area clay and Kankar are the main lithological units with thickness of 50 to 55 m below ground level. Fine to medium sand is encountered after 60 to 85m depth in south-western and central parts of the cross-sectional area. A patch of coarse grained sand is encountered at Hanumangarh at 25 m depth with thickness of 40 to 45 m below ground level.

The saturated thickness of alluvium in south-western part (Bijaynagar) is 55 m below ground level while in north-eastern part (Hanumangarh), the saturated thickness is 50 m below ground level. In Harsinghpura the groundwater level is 23 m below ground level while in Hanumangarh it is 17 m below ground level.

Figure 1.6-1 Hydrogeological Cross Section Lines of ACZ I(b)

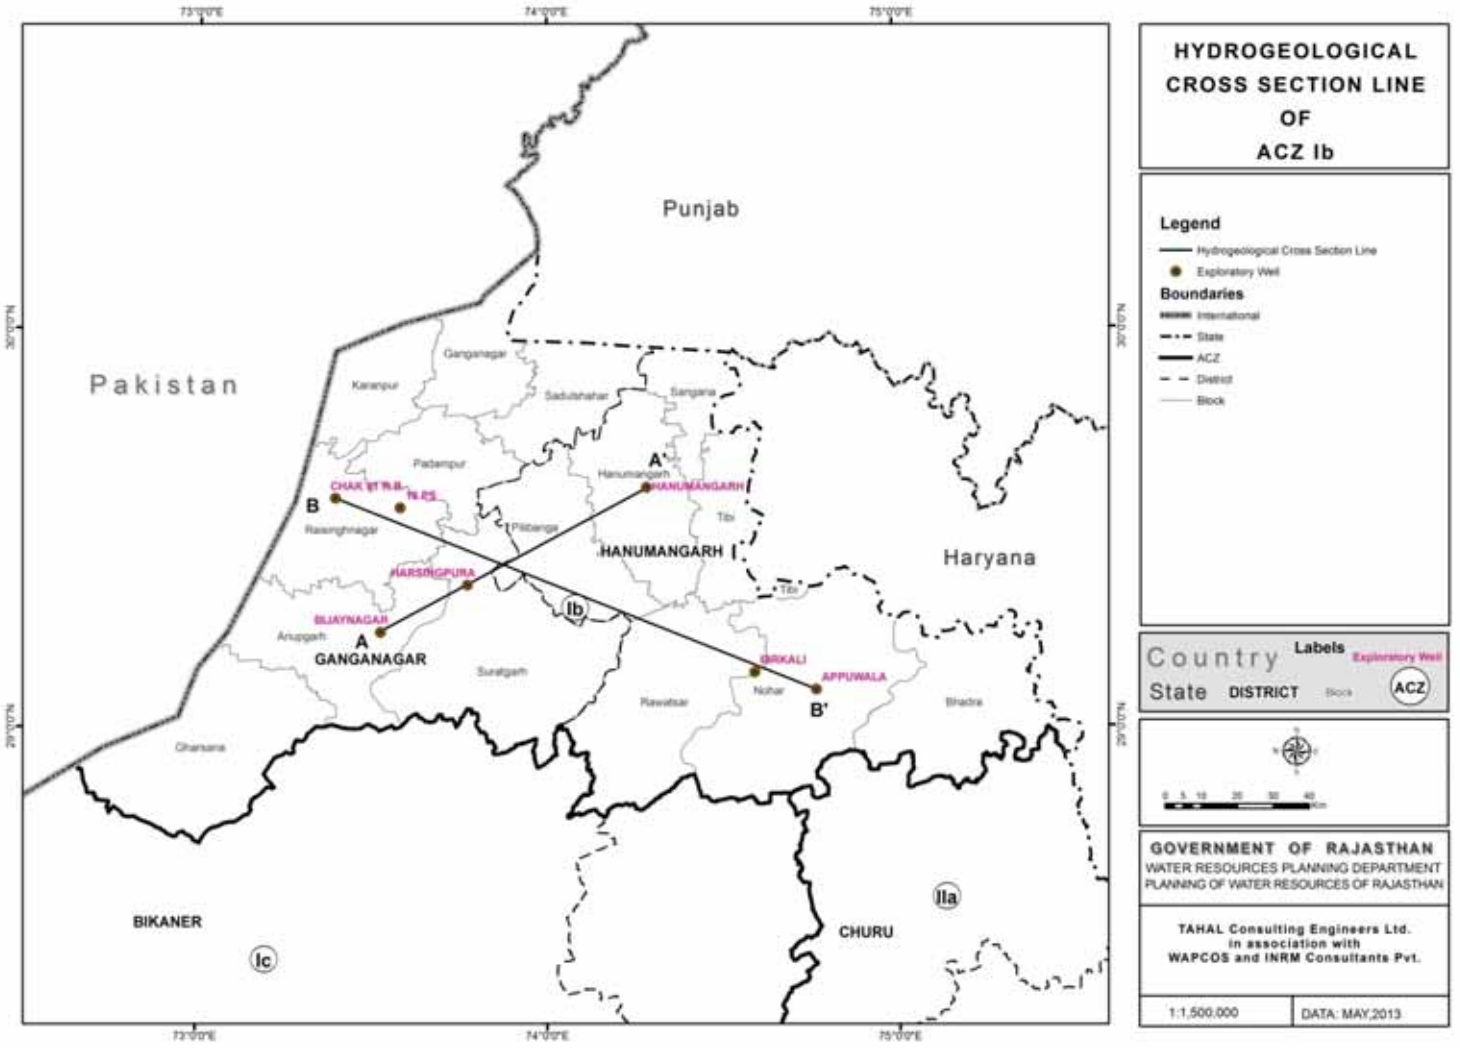

Figure 1.6-2 Hydrogeological Cross section A-A': (Bijaynagar- Hanumangarh)

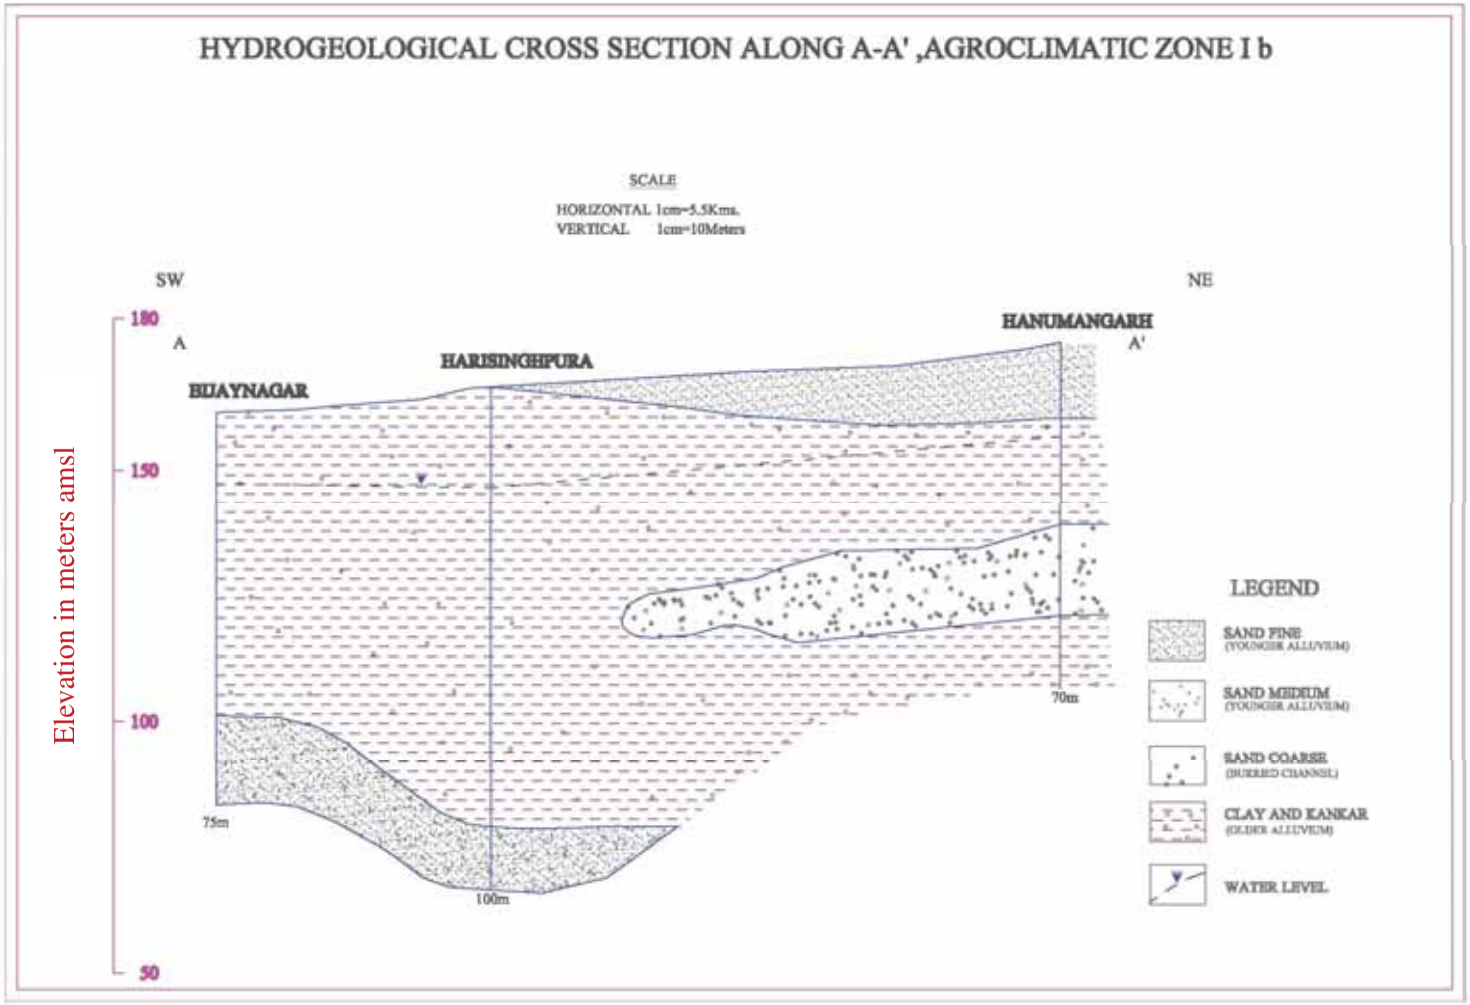

Source: - CGWB and RGWD

Hydrogeological cross – section B-B' (Chak 81 RB – Appuwala)

The cross–section B-B' (Figure 1.6-2) has been drawn from Chak 81 RB to Appuwala village in north–western to south – eastern direction. Total length of the cross – section is 140 kms. The ground level elevation ranges from RL 161 meters (Chak 81 RB) to RL 193 meters (Appuwala) above mean sea level. The cross – section reveals that whole cross – sectional area is occupied by older alluvium of Quaternary age comprising fine to medium grained sand along with clay and kankar. In south – eastern part of the cross- sectional area alluvium is comprised of well sorted sediments with medium grained sand (Appuwala, Birkali) while in north–western part clay and kankar are the main constituents in alluvium. The maximum thickness of alluvium is 150 meters below ground level. The water level ranges from 16 meters below ground level (Chak 81 RB) to 25 meters below ground level (Appuwala).

1.7 Depth to Groundwater

Pre-monsoon and post-monsoon (2010) groundwater level maps of the ACZ I(b) is at Drawing No. ACZ I(b)-003 and Drawing No. ACZ I(b)-004. Pre-monsoon water levels in most part of ACZ range from less than 2m to 20m (bgl). Two small areas of relatively deep groundwater levels exist in ACZ in its northern part in Pilibanga and Sadulshehar blocks of Hanumangarh district and in a continuous patch that exists in Mohar–Rawatsar-Suratgarh block of Hanumangarh district.

1.8 Groundwater Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ I (b) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-Wise / Aquifer-Wise Fluctuation in Levels of Groundwater ACZ I(b)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)
Ganganagar	Anupgarh	Younger Alluvium	15	-0.95	6.38	0.66
	Ganganagar	Younger Alluvium	18	-0.99	2.64	0.30
	Gharsana	Younger Alluvium	5	-1.39	0.03	-0.71
	Karanpur	Younger Alluvium	21	-0.76	4.13	0.33
	Padampur	Younger Alluvium	17	-3.22	2.22	-0.14
	Raisinghnagar	Younger Alluvium	19	-0.42	0.76	0.20
	Sadulshahar	Younger Alluvium	13	-3.57	4.97	0.11
	Suratgarh	Younger Alluvium	28	-3.26	10.10	0.37
Hanumangarh	Bhadra	Younger Alluvium	19	-4.75	3.39	0.01
	Hanumangarh	Younger Alluvium	22	-3.39	7.94	-0.25
	Nohar	Younger Alluvium	16	-5.45	5.44	-0.11
	Pilibanga	Younger Alluvium	11	-5.94	2.28	-0.75
	Rawatsar	Older Alluvium	1	-0.30	-0.30	-0.30
		Younger Alluvium	17	-7.10	0.95	-0.47
	Sangaria	Younger Alluvium	10	-1.37	1.59	-0.10
	Tibi	Younger Alluvium	8	-2.87	1.89	-0.22
ACZ Summary			**240**	**-7.10**	**10.10**	**0.02**

Source: - CGWB and RGWD

From the table it can be seen that average fluctuation in levels of ground water in younger alluvium aquifer in the ACZ ranges from - 0.71m in Gharsana block of Ganganagar district to 0.66 m in Anupgarh block of Ganganagar district.

1.9 Groundwater Levels and Flow Directions

This ACZ constitutes the northern portion of the Outside Basin in Hanumangarh and Ganganagar districts, which consists the east – west strip of the Ghaggar Basin. The operative aquifer there, on the Punjab border, is the Younger and Older Alluvium and wind blown sands (Map ACZ Ib-001). There is no particular feature of drainage pattern and the only channels there are those of the IGNP, Gang canal and Bhadra canal.

During the year 2010, in most of the area Groundwater depth is very shallow, ranging from less than 2 m bgl to about 20 m bgl. However, there are three relatively large areas with deeper than 20 m bgl - in Ghadsana block along international border, in the southern borders of Suratgarh, Rawatsar and Nohar Blocks and along the triangle border between the blocks Pilbanga, Sadulshahar and Hanumangarh (Map ACZ Ib-003). The reason is the network of the IGNP, Gang and Bhadra canals and distributaries from which huge quantities of water seep and are lost, obliterating the normal groundwater regime. These waters create serious water logging in places but, on the other hand, provide significant recharge and quality improvement in other stretches along the course of the IGNP canals.

In terms of hydraulic gradient, the water level surface there is almost flat, 0.2 – 0.3m per 1km. The drainage, however, is towards border in the southwest but the outflow is therefore very small (Map ACZ Ib-002).

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ I(b) are shown in Figure 1.10-1 to 1.10-15. The supportive data for the same is given in Annex 9.

1.10.1 Hanumangarh District

The pre-monsoon average ground water level in Hanumangarh district in 1984 vary between a minimum of 155.01 m amsl (Rawatsar block) and maximum of 182.39 m amsl (Bhadra block) while in the year 2010 the pre-monsoon average ground water level in this district range from a minimum of 161.04 m amsl (Pilibanga block) to a maximum of 186.27 m amsl (Bhadra block). Long-term groundwater levels in each block are presented in Figure 1.10-1 to Figure 1.10-7. The level change rates are given in Table 1.10-1. In most of the district area a moderate increase with a maximum average rate of ~0.46 m/y took place (Sangariya block, pre monsoon; Table 1.10-1). In several areas, the drop rate reached -0.09 m/yr per well. This is in spite of the typical increasing levels in this part of the state. A wide point of view rises that the stage of development of the aquifer in this part of the district is higher than in the rest of the district and close to 100% out of the annual recharge. This may be since the local recharge sources (leaking from the canal and percolation of irrigation water) creates lower flux that is not sufficient to compensate the natural declining levels (if the infiltration caused by artificial sources of water, such as irrigation and channel flows, did not exist the groundwater levels were probably declining). Thus, the levels keep declining in these areas (Tibi Block). The spatial average long-term trend of the district is increasing by ~0.19 m/y (Pre Monsoon; Table 1.10-1) and this is the dominant trend of the district.

1.10.2 Ganganagar District

The pre-monsoon average ground water level in Ganganagar district in 1984 vary between a minimum of 123.98 m amsl (Ghadsana block) and a maximum of 165.80 m amsl (Ganganagar block) while in the year 2010 the pre-monsoon average ground water level in this district range from a minimum of 137.87 m amsl (Ghadsana block) to a maximum of 167.18 m (Ganganagar block). Long-term groundwater levels in each block are presented in Table 1.10-1 and Figure 1.10-8 to 1.10-15.

In all blocks, there are rising trends of groundwater levels. Watertable trends in all blocks present sharp to moderate increases with a maximum of above 0.54 m/y in Ghadsana Block (Pre-Monsoon average data 1984-2010) at the western part of the district. Average increase is ~0.4 m/y (Table 1.10-1, Pre Monsoon). This sharp rises are probably since most of the area includes major irrigation projects like the Gang Canal at the north and the "Indira Gandhi" canal at the west. Groundwater recharge occurs from two principal sources: (1) Leaching of excess irrigation water (2) Percolation of surface water that leaches out of the canals and infiltrates into the ground. The rising of groundwater levels needs to be controlled due to two main reasons: (1) prevent water logging at the surface (2) salinization processes.

Based on the long-term water level trends, future water levels have been predicted for pre and post monsoon and accordingly prediction of dry monitoring wells has been done and presented in Table 1.10-2.

Table 1.10-1 Long-term Groundwater Levels Change Rates ACZ I(b) 1984-2010

District	Block	Main Formation	Pre Monsoon					Post Monsoon				
			Water Level [m amsl]		Change Rates [m/y]			Water Level [m amsl]		Change Rates [m/y]

1.11 Long-Term Drafts

The total draft in ACZ I(b) is almost unchanged throughout the examined time period. It ranged from 288 Mm^3 during 1995 to 323 during 2009 – a relative rise of ~12%. The abstractions are approximately equal in both Hanumangarh and Ganganagar districts with averages of 163 Mm^3 (0.016 Mm^3/km^2) and 160 Mm^3 (0.014 Mm^3/km^2) respectively (Figure 1.11-1 and Figure 1.11-2, Table 1.11-3). Most of the use of groundwater in the ACZ is for irrigation – during 2009 311Mm^3 (96%) were consumed for irrigation while only 12 Mm^3 (4%) for domestic and industrial uses. Block-wise details of groundwater draft are presented in Table 1.11-3.

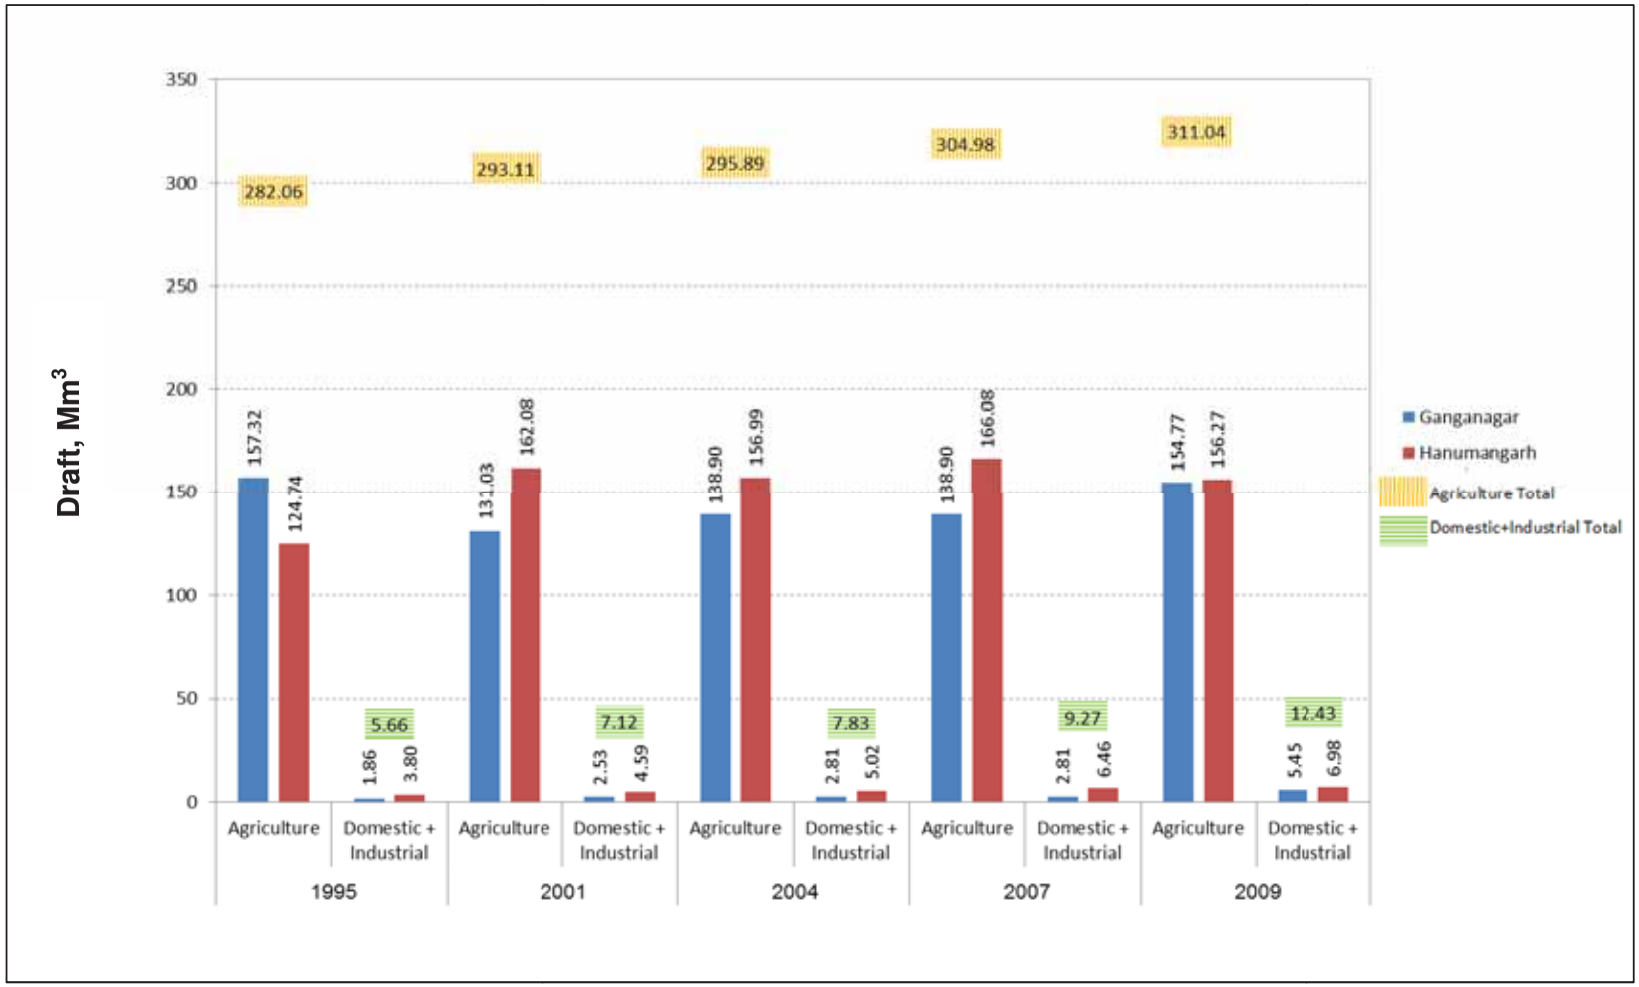
Source: CGWB and RGWD

Figure 1.11-2 Groundwater Draft for Agriculture and Other Uses in ACZ I(b) by Districts



Source: CGWB and RGWD

1.11.1 Hanumangarh District

Groundwater abstraction in this district reached 163 Mm^3 during 2009 which comprises ~50% out of the total draft in the ACZ. The draft increased from 128 Mm^3 during 1995 to 163 Mm^3 during 2009 – a relative growth of ~26% (Figure 1.11-3, Table 1.11-3). Hanumangarh and Pilibanga blocks present the largest draft in the district with 31% and 28%, respectively out of the total draft during 2009. Rawatsar and Nohar blocks show the lowest draft in the district with 2% each (2009). In all blocks of Hanumangarh district the draft are relatively stable throughout the years while the domestic and industrial sectors comprise only a minor portion out of the total draft - around 2% - 4% (Table 1.11-1).

Table 1.11-1 Change in Groundwater Draft in Hanumangarh District 1995 -2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change	Remarks
Bhadra	-16%	> +500%	-1%	During 1995 there was almost no domestic & industrial draft
Hanumangarh	26%	31%	26%	
Nohar	188%	> +500%	193%	During 1995 there was almost no domestic & industrial draft
Pilibanga	26%	31%	26%	
Rawatsar	188%	> +500%	193%	During 1995 there was almost no domestic & industrial draft

1.11.2 Ganganagar District

Groundwater draft in this district reached 160 Mm^3 during 2009, which is ~50% of the total draft in the ACZ. The draft in this district is hardly unchanged in the long term, with 159 Mm^3 during 1995 and 160 Mm^3 during 2009, nevertheless during 2001 the draft dropped to 134 Mm^3.Ganganagar block presents the highest drafts with ~41% out of the total draft during 2009. 99% out of Ganganagar's draft has been used for irrigation during 2009. The lowest drafts are measured in Anupgarh and Ghadsana blocks with 3% - 3% out of the total consumption of groundwater in the district. During the examined time period the draft remain relatively unchanged in most of the blocks and in the whole district as well (Figure 1.11- 4, 1.11-2 and Table 1.11-3).

Table 1.11-2 Change in Groundwater Draft in Ganganagar District from 1995 to 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change	Remarks
Anupgarh	+35%	+400%	+38%	
Ghadsana	+35%	+400%	+38%	
Ganganagar	-5%	+7%	-5%	
Karanpur	+2%	+300%	+4%	
Padampur	+325%	+200%	+320%	
Raisinghnagar	+102%	+500%	+109%	
Sadulshahar	-64%	> +500%	-64%	During 1995 there was almost no domestic & industrial draft
Suratgarh	-52%	+377%	-45%	
District Total	-2%	193%	1%

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block-Wise

Out of total number of 4,957 villages in ACZ I (b), 2091 are found suitable for drinking water use, 1851 for irrigation use and 4077 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in groundwater is summarised in Table 1.12-1.

Table 1.12-1 Village and Block-wise Water Quality

Source: - CGWB and RGWD

It may be seen from above that out of 4957 villages of ACZ Ib, 1026 fall under desirable, 3095 under maximum permissible limit and 836 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 2067 while number of villages with maximum permissible limit of use is 1192 and number of above maximum permissible limit for Fluoride is 1698. As regards presence of nitrate in ground water, 1481 fall under highest desirable limit of less than 45 mg/l and 2063 under maximum permissible limit along with 1413 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 1730 villages fall under maximum permissible limit and 3106 under above maximum permissible limit of 2250 microhos/cm and 121 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

Groundwater Quality of ACZ I(b) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ I(b) is shown in Drawing No. ACZ I(b)-005. By and large chloride levels of shallow groundwater of the ACZ are in the range of 250-1000 mg/l. Potable groundwater with less than 250 mg/l of chloride concentration occurs in northern part of the ACZ in Older/ Younger alluvium in parts of Hanumangarh and Ganganagar districts and as isolated pockets in southern and eastern part of the ACZ. Areas in pockets of higher concentration of chloride, beyond 1000 mg/l exist in Younger and Older alluvium aquifers in Tibi (Younger Alluvium), Nohar (Younger Alluvium), Bhadara (Younger Alluvium), and Rawatsar block of Hanumangarh district and in Raising Nagar and Anupgarh blocks (Younger Alluvium) of Ganganagar district.

Block-wise / aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in Table 1.12-2.

Table 1.12-2 Percent Area Occupied with Various Level of Chloride in Groundwater of ACZ I (b)

District	Block	Hydrogeological Unit	Percent area occupied with various level of Chloride, mg/l		
			< 250	250 - 1,000	> 1,000
Ganganagar	Anupgarh	Older Alluvium	0.00	100.00	0.00

Source: - CGWB and RGWD

It may be seen from the table, that only 20% area of alluvial aquifer system in Ganganagar district and Hanumangarh district bear potable quality groundwater with chloride value of <250 mg/l. The 100% area of Older alluvium and 98% of Younger alluvium aquifer in Ghadsana block of Ganganagar district bear groundwater having chloride concentration in the range of 250-1,000 mg/l. Also 86% area of Younger alluvium in Sangariya block, 100% area of Vindhyan Sandstone in Nohar block bear unsuitable quality groundwater. The percent area occupied with chloride level of 250-1,000 mg/l range from 37 to 100% in Ganganagar district and from 30% to 100 % in Hanumangarh district.

Groundwater Quality of ACZ I (b) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ I(b) is shown in Drawing No. ACZ I(b)-006. From the map, it can be observed that nearly half of the area of alluvium aquifer of ACZ is occupied with high level NO_3 concentrations of >100 mg/l in Nohar, Bhadra and Rawatsar and Tibi blocks of Hanumangarh district and Suratgarh, Anupgarh and Gharsana blocks of Ganganagar. The remaining area of the district bear relatively fresh groundwater with NO_3 contents falling below 45 mg/l and 100 mg/l.

Block-wise / aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

Table 1.12-3 Percent Area Occupied with Various Level of Nitrate in Groundwater of ACZ I (b)

District	Block	Hydrogeological Unit	Percent area occupied with various level of Nitrate, mg/l		
			< 45	45 - 100	> 100

Source: - CGWB and RGWD

From above table, it can be observed that 46% area of Ganganagar is covered with potable quality groundwater with respect to nitrate levels of groundwater, whereas only about 15% area is covered with potable quality groundwater in Hanumangarh district of ACZ.

Groundwater Quality of ACZ I (b) by fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ I(b) is shown in Drawing No. ACZ I(b)-007.

It may be seen from the map that non-potable ground water with fluoride content exceeding 1.5 mg/l is present in western and south-western part of the ACZ in Ganganagar district with isolated pockets in northern part in Ganganagar district, eastern and north-eastern parts in Hanumangarh district. This higher concentration of fluoride occurs in older and younger alluvium aquifer of the ACZ. In remaining part of the ACZ in both the districts of Hanumangarh and Ganganagar the ground water is fresh and potable in alluvial aquifer system of the ACZ.

Block-wise / aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

Table 1.12-4 Percent Area Occupied with Various Level of Fluoride in Groundwater of ACZ I (b)

ACZ Ib Summary			**42.23**	**23.08**	**34.69**

Source: - CGWB and RGWD

It may be seen from the above table that 42.23% area of the ACZ possesses potable ground water with Fluoride content of ground water being less than 1 mg/l. 100% non-potable ground water areas pertain to older alluvium aquifer unit in Anupgarh and Gharsana block and more than 83% to older alluvium aquifer unit of Suratgarh block of Ganganagar district.

Groundwater Quality of ACZ I (b) by EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ I(b) is shown in Drawing No. ACZ I(b)-008. From map, it may be seen that a large part of ACZ I (b) in its southern part in Hanumangarh and Ganganagar districts bear high EC level groundwater in the range of 2250-5000 and beyond 5000 micromhos/cm.

Block-wise / aquifer-wise percent area occupied with various levels of EC in groundwater of ACZ is shown in Table 1.12-5.

Table 1.12-5 Percent Area Occupied with Various Level of EC in Groundwater of ACZ I (b)

District	Block	Hydrogeological Unit	Percent area occupied with various level of Electric Conductivity, micromhos/cm

Source: - CGWB and RGWD

From table it may be observed that Older alluvium aquifer unit in Anupgarh block of Ganganagar district occupy 100 % area with EC of groundwater in the range of 2,250-5,000 micromhos/cm. Also Vindhyan sandstone aquifer in Nohar block of Hanumangarh district occupies 100% area with EC in the range of 2,250-5,000 micromhos/cm.

1.12.3 Long-Term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ I(b) are shown in Figure 1.12-1 to 1.12-28. The supportive data for the same is given in Annex 10.

Hanumangarh District

Average chloride and EC concentrations per block for the period 1984-2009 are presented in Figure 1.12-1 to Figure 1.12-13 (odd figures). The graphs demonstrate well the good correlation between the two parameters in most of the blocks. Long-term trends of average chlorides fluctuate widely within the range of 200 to 1,500 mg/l. However, average concentrations vary between a minimum of ~150 mg/l in Tibi block to a maximum of ~1,400 mg/l (above the permissible limit for drinking) in Sangariya and Rawatsar blocks. From spatial perspective it seems that particularly sharp increase took place in Sangariya block from below 400 mg/l in 1987 to above 1,200 mg/l in 2008. This block is characterized by a high 'draft per area' ratio of more than 0.2 Mm^3/km^2, likewise the population density in this block and the surrounding blocks is high and reach above 350 P/km^2. It is assumed that inputs from urban and agriculture sources are the cause to this increase such as return flow from irrigation and leakage of waste water. A unique phenomenon in this area is the decrease in chloride concentration at the district level, during the period under review. The concentrations in the blocks of Pilibanga, Hanumangarh and Tibi decline at a maximum rate of almost 5 mg/l/y. This process correlates well to the rising trend in groundwater levels that was recorded in most of the blocks. The rise of the water table is attributed to leakage from the extensive irrigation canals network covering the area.

EC trends follow closely the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly between 2,000 and 8,000 µS/cm; much higher than the permissible limit for drinking. Minimum concentrations were

recorded in Pilibanga and Tibi blocks (1,000 to 4,000 µS/cm) while maximum (average) concentrations are observed, similarly to Cl, in Rawatsar block, reaching as high as 13,000 µS/cm. While in Pilibanga block levels decreased from ~3,000 µS/cm (1992) to slightly above 1,000 µS/cm (2007), in Rawatsar block EC increase was recorded from ~4,000 µS/cm (1992) to almost 14,000 µS/cm (2009). Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ I(b)-009.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figure 1.12-2 to Figure 1.12-14 (even figures). Average NO_3 concentrations in most blocks are between 100 and 200 mg/l; higher than the permissible limit for drinking (100 mg/l). Peak values were recorded in Nohar block and reach 400 mg/l (1990-1994). Rawatsar block presents also high values throughout the examined period. The long-term trend in Nohar and Pilibanga blocks presents a decreasing trend while the rest of the blocks concentrations present a gradual increase.

Fluoride (F) concentrations are presented in Figure 1.12-2 to Figure 1.12-14, along with the nitrates. In general, concentrations in the district fluctuate between 1-4 mg/l. In most blocks, most of the time, F levels range around the permissible limit for drinking (1.5 mg/l). Pilibanga and Nohar blocks present the lowest average levels in the district which reach as low as 0.5 mg/l. In all blocks except Hanumangarh a moderate and consistent decrease in concentrations took place with an average of 0.06 mg/l/y.

Ganganagar District

Average chloride and EC concentrations per block for the period 1984-2009 are displayed in Figure 1.12-15 to Figure 1.12-27 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary between a minimum of ~150 mg/l in Padampur block to a maximum of ~1,400 mg/l (above the permissible limit for drinking) in Suratgarh and Anupgarh blocks. The long-term trend varies between an increase rate of >3 mg/l/y in Raisinghnagar Block and a decrease rate of over 2 mg/l/y in Padampur Block. However, it appears that most of the blocks have witnessed a moderate increase or stability of Chloride concentrations. From a spatial perspective one can see that at the southern part of the district around the blocks at Suratgarh and Anupgarh, a salinization plume developed between the years 1990-2005 reaching peak concentrations of 1,400 mg/l. Towards the year 2010 the plume shifted north-westward to Raisinghnagar block and led to consistent increase trends in those blocks. The reason to this shift is not totally clear but it may be relate to agricultural trend that lead to changes in the draft and irrigation patterns. Groundwater is relatively shallow in these areas especially in the central part of Suratgarh block, enhancing the vulnerability of the aquifer to salinization.

EC trends follow the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly between 2,000 and 8,000 µS/cm; much higher than the permissible limit for drinking. Minimum concentrations were recorded in Pilibanga and Padampur blocks (1,000 to 6,000 µS/cm) while maximum (average) concentrations are observed in Anupgarh block, reaching as high as 11,000 µS/cm. From a spatial perspective, it appears that the EC concentrations are relatively stable over the years in most of the blocks, while in at Suratgarh, Anupgarh and

Raisinghnagar blocks the long-term EC trends is following the Cl trends (see above). This statistic reinforces the assumption that the Cl pollution is from upper sources like percolation of saline water of surplus irrigation. However, in Ganganagar and Padampur blocks a distinct decreasing trend in EC levels is visible, reaching a rate of >30 µS/cm/y.

Average NO_3 and F levels per block for the period 1984-2009 are displayed in Figure 1.12-16 to Figure 1.12-28 (even figures). Average NO_3 concentrations in most blocks are between 50 and 150 mg/l; around the permissible limit for drinking (100 mg/l). None the less in the blocks of Suratgarh and Karanpur nitrate concentrations are significantly higher and rise above 500 mg/l. Groundwater in this area is shallow (less than 10 m in most of the area).The high nitrate concentrations, especially in Central Suratgarh block, correlate to the high chloride concentrations in this area and suggest a single same source probably related to agriculture activity.

Fluoride concentrations are presented in Figures 1.10-16 to Figure 1.10-28, along with the nitrates. In general, concentrations in the district fluctuate between 1-3 mg/l. In most blocks, most of the time, F levels are around the permissible limit for drinking (1.5 mg/l) and there is moderate decline trend in all blocks. Yet in Suratgarh and Karanpur blocks values are relatively high and until to the mid-nineties exceeded beyond 3 mg/l.

1.13 Groundwater Suitability for Agriculture

Aquifer wise classification of irrigation water yield in ACZ I (b) is shown in Table 1.13-1.

Table 1.13-1 Aquifer Classification of Irrigation Water

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
1	Older Alluvium	C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
2	Vindhyan Sandstone	C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
3	Younger Alluvium	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
3	Younger Alluvium	C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium

As may be seen from table, eight water classes in Older alluvium, five in Vindhyan sandstone and 12 in Younger alluvium could be deciphered.

The salinity/sodium hazard ranges from high salinity and low sodium class to very high salinity and very high sodium class in older alluvium unit. In Vindhyan sandstone aquifer it ranges from very high salinity and low sodium to very high salinity and medium sodium. As regards younger alluvium unit, various water classes range from medium salinity and low sodium to very high salinity and very high sodium.

It may be seen from the Map (Drawing No. ACZ I(b)-009) that excellent to good quality ground water suitable for irrigation exists in Hanumangarh, Suratgarh and south of Karanpur shown as dark and light green patches in map. Ground water of very bad quality mostly unsuitable for irrigation in most soils exists along southern extremity of the ACZ.

As may be seen from map (Drawing No. ACZ I(b)-009), the excellent to good class irrigation water (C_2 S_1 to C_3 S_4) exist all over ACZ, except southern merge of ACZ.

1.14 Groundwater Draft Village-Wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ I(b). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Groundwater Abstractions in ACZ I(b)

District	Block	Hydrogeological Unit	Gross Draft in Fresh Groundwater		
			Agricultural, Mm^3/yr	Domestic and Industrial, Mm^3/yr	All Uses, Mm^3/yr
Ganganagar	Anupgarh	Older Alluvium	-	-	-
		Younger Alluvium	7.15	0.48	7.63
	Block Total		**7.15**	**0.48**	**7.63**
	Ganganagar	Younger Alluvium	27.59	7.81	35.40
	Block Total		**27.59**	**7.81**	**35.40**
	Gharsana	Older Alluvium	-	-	-
		Younger Alluvium	5.31	0.54	5.85
	Block Total		**5.31**	**0.54**	**5.85**
	Karanpur	Younger Alluvium	24.96	0.22	25.18

District	Block	Hydrogeological Unit	Gross Draft in Fresh Groundwater		
			Agricultural, Mm^3/yr	Domestic and Industrial, Mm^3/yr	All Uses, Mm^3/yr

	Block Total		**9.50**	**0.04**	**9.54**
	Sadulshahar	Younger Alluvium	8.46	0.16	8.62
	Block Total		**8.46**	**0.16**	**8.62**
	Suratgarh	Older Alluvium	-	-	-
		Younger Alluvium	10.01	3.37	13.38
	Block Total		**10.01**	**3.37**	**13.38**
District Total			**107.70**	**12.80**	**120.50**
Hanumangarh	Bhadra	Older Alluvium	-	-	-
		Younger Alluvium	11.16	3.52	14.68
	Block Total		**11.16**	**3.52**	**14.68**
	Hanumangarh	Younger Alluvium	40.22	6.31	46.53
	Block Total		**40.22**	**6.31**	**46.53**
	Nohar	Older Alluvium	-	-	-
		Vindhyan Sandstone	-	-	-
		Younger Alluvium	5.69	0.20	5.89
	Block Total		**5.69**	**0.20**	**5.89**
	Pilibanga	Younger Alluvium	37.32	2.02	39.34
	Block Total		**37.32**	**2.02**	**39.34**
	Rawatsar	Older Alluvium	-	-	-
		Younger Alluvium	-	-	-
	Block Total		**-**	**-**	**-**
	Sangaria	Younger Alluvium	8.65	1.89	10.54
	Block Total		**8.65**	**1.89**	**10.54**
	Tibi	Younger Alluvium	40.31	1.06	41.37
	Block Total		**40.31**	**1.06**	**41.37**
District Total			**143.34**	**15.01**	**158.35**
ACZ Total			**251.04**	**27.81**	**278.85**

Source: - Village wise Data of Tehsil, CGWB and RGWD

It may be seen from the above table that total ground water abstraction in the ACZ work out to 278.85 Mm^3 which include 251.04 Mm^3 as agriculture draft and 27.81 Mm^3 as domestic and industrial draft.

In Ganganagar district out of total ground water abstraction of 120.50 Mm^3, 107.70 Mm^3 are abstracted as agriculture draft and 12.80 Mm^3 as domestic and industrial draft. Almost all abstractions are obtained from alluvial aquifer system of the district. Maximum abstractions of 35.40 Mm^3 are yielded from alluvium aquifer system of Ganganagar block of the district.

In Hanumangarh district, a total of 158.35 Mm^3 of ground water is abstracted which includes 143.34 Mm^3 as agriculture draft and 15.01 Mm^3 as domestic and industrial draft. Maximum abstractions of 46.53 Mm^3 from Hanumangarh block of the district which contribute to the maximum abstraction from alluvial aquifer in the district.

1.15 Static Groundwater Resources

1.15.1 Static Groundwater Resource (Fresh Groundwater)

The Fresh static groundwater resources of ACZ I (b) for year 2010 are given in Table 1.15-1.

Table 1.15-1 Fresh Static Groundwater Resources of ACZ I(b), Mm^3

District	Block	Hydrogeological Unit	Static Groundwater Resources, Mm^3
Ganganagar	Anupgarh	Older Alluvium	-
		Younger Alluvium	89.74
	Block Total		**89.74**
	Ganganagar	Younger Alluvium	164.08
	Block Total		**164.08**
	Gharsana	Older Alluvium	0.86
		Younger Alluvium	87.07
	Block Total		**87.93**
	Karanpur	Younger Alluvium	105.36
	Block Total		**105.36**
	Padampur	Younger Alluvium	61.26
	Block Total		**61.26**
	Raisinghnagar	Younger Alluvium	37.99
	Block Total		**37.99**
	Sadulshahar	Younger Alluvium	58.33

	Block Total		**44.08**
	Tibi	Younger Alluvium	106.64
	Block Total		**106.64**

District	Block	Hydrogeological Unit	Static Groundwater Resources, Mm^3
District Total			**519.74**
ACZ Ib Total			**1,220.48**

Source: CGWB and RGWD
Note: Zero availability means negligible value

In this ACZ, of the total assessed static groundwater 1,220.48 Mm^3, about 700.74 Mm^3 is present in various aquifer units of Ganganagar district, the maximum of 164.08 Mm^3 occurring in Younger alluvium of Ganganagar block of Ganganagar district. The static ground water resources in Hanumangarh district is assessed at 519.74 Mm^3, the maximum of 121.45 Mm^3 are contained in Younger alluvium aquifer unit of Pilibanga block of Hanumangarh district.

1.15.2 Static Groundwater Resources (Saline Groundwater)

The saline static groundwater resources of ACZ I(b) for year 2010 are given in Table 1.15-2.

Table 1.15-2 Saline Static Groundwater Resources of ACZ I(b)

District	Block	Hydrogeological Unit	Static Groundwater Resources, Mm^3
Ganganagar	Anupgarh	Older Alluvium	18.76
		Younger Alluvium	324.57
	Block Total		**343.33**
	Ganganagar	Younger Alluvium	141.02
	Block Total		**141.02**
	Gharsana	Older Alluvium	80.88

District Total			**2,458.57**
ACZ Ib Total			**4,588.18**

Source: - CGWB and RGWD
Note: - Zero availability means negligible value

In this ACZ, the total assessed saline static groundwater recourses amount to 4,588.18 Mm^3, out of which 2,458.57 Mm^3 are present in Hanumangarh district and 2,129.61 Mm^3 in Ganganagar district. Among blocks, the maximum resources of 607.94 Mm^3 are present in Nohar block of Hanumangarh district.

1.16 Dynamic Groundwater Resources

1.16.1 Dynamic Groundwater Resource (Fresh Groundwater)

The assessed net availability of dynamic groundwater resource, groundwater abstraction for all type of uses, the stage of groundwater development and category of development block for ACZ for year 2010 is shown in Table 1.16-1.

Table 1.16-1 Fresh Dynamic Groundwater Resources (2010) of ACZ I (b)

District	Block	Hydrogeological Unit	Net Groundwater Availability, Mm^3	Gross Draft for All Uses, Mm^3	Stage of Groundwater Development, %	Category

	Block Total		**46.27**	**41.37**	**89.41**	**Safe**
District Total			**197.89**	**158.35**	**80.02**	**Safe**
ACZ Ib Total			**488.12**	**278.85**	**57.13**	**Safe**

Note: Zero availability means negligible value

It may be seen from the table that net groundwater availability in the ACZ is assessed as 488.12 Mm^3 and draft for all types of uses as 278.85 Mm^3. This works out the stage of groundwater development in ACZ as 57.13 % giving the zone a safe status. The village wise fresh dynamic resources and stage of ground water development are given in Annex 6(b). The village wise map of ACZ I(b) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ I(b)-010.

Of the total 14 blocks of ACZ, all the blocks in both Ganganagar and Hanumangarh district fall under Safe category.

1.16.2 Dynamic Groundwater Resource (Saline Groundwater)

The assessed net availability of saline dynamic groundwater resource for the ACZ for year 2010 is shown in Table 1.16-2.

Table 1.16-2 Saline Dynamic Groundwater Resources (2010) of ACZ I(b)

District	Block	Hydrogeological Unit	Net Groundwater Availability, Mm^3
Ganganagar	Anupgarh	Older Alluvium	4.41
		Younger Alluvium	144.26
	Block Total		**148.67**
	Ganganagar	Younger Alluvium	74.61
	Block Total		**74.61**
	Gharsana	Older Alluvium	19.40
		Younger Alluvium	123.44
	Block Total		**142.84**
	Karanpur	Younger Alluvium	81.48
	Block Total		**81.48**
	Padampur	Younger Alluvium	84.04
	Block Total		**84.04**
	Raisinghnagar	Younger Alluvium	147.83
	Block Total		**147.83**
	Sadulshahar	Younger Alluvium	99.72
	Block Total		**99.72**
	Suratgarh	Older Alluvium	4.37
		Younger Alluvium	152.93
	Block Total		**157.31**
District Total			**936.50**
Hanumangarh	Bhadra	Older Alluvium	0.00
		Younger Alluvium	89.77
	Block Total		**89.77**
	Hanumangarh	Younger Alluvium	122.53
	Block Total		**122.53**
	Nohar	Older Alluvium	9.31
		Vindhyan Sandstone	0.41
		Younger Alluvium	125.65
	Block Total		**135.37**
	Pilibanga	Younger Alluvium	89.03
	Block Total		**89.03**
	Rawatsar	Older Alluvium	3.30
		Younger Alluvium	115.42
	Block Total		**118.72**
	Sangaria	Younger Alluvium	56.48
	Block Total		**56.48**
	Tibi	Younger Alluvium	65.35
	Block Total		**65.35**

District	Block	Hydrogeological Unit	Net Groundwater Availability, Mm^3
District Total			**677.25**
ACZ Ib Total			**1,613.75**

Note: Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 1,613.75 Mm^3. The net ground water availability in Ganganagar district part of the ACZ is 936.50 Mm^3 while that of Hanumangarh district is 677.25 Mm^3. The maximum net ground water availability is 157.31 Mm^3 in Suratgarh block of Ganganagar district.

1.17 Assessment of Groundwater Availability

The net dynamic fresh groundwater availability at year 2010 in ACZ I (b) is 488.12 Mm^3 and groundwater draft for all uses is 278.85 Mm^3. The stage of groundwater development in zone is 57.13% and is categorised as safe zone. Saline groundwater resource of the zone is assessed at 1,613.75 Mm^3.

The total static groundwater resource in ACZ is assessed at 5,808.66 Mm^3, out of which 4,588.18 Mm^3 (78.99%) is saline groundwater.

1. Groundwater Study of Agroclimatic Zone I(c)

1.1 General

The ACZ covers an area of 77,001.84 km^2 covering Bikaner, Jaisalmer and part of Churu districts. The average annual rainfall in zone is 281.4 mm and mean annual evaporation 247.5 mm.

1.2 Geology

Nearly half of the ACZ I (c) is comprised of Quaternary to Recent alluvium covered with wind blown sand. The next most commonly occurring group of rocks are sandstone and limestone of Jurassic and Tertiary age. The ACZ also comprises granites and metamorphic suite of rocks in its southern part.

1.3 Hydrogeology

Hydrogeology of hydro-strategraphic units as aquifers occurring in ACZ is described in following paragraph. Area occupied by various aquifer units in different blocks and districts of covering ACZ is given in Table 1.4-1. Hydrogeological map of ACZ I (c) is at Drawing No. ACZ I(a)-001.

Alluvium

This alluvium is comprised of both Younger and Older alluvium and mainly consists of sand, silt and clay in varying proportions. The maximum thickness of the alluvium is approximately 200 m. The formation is very widely spread west of Jaisalmer and in the northern parts of Bikaner and Churu districts. In some places this unit contains saline groundwater and the areas are unproductive. Therefore, the Alluvium is considered an aquifer of very low quality. Only small areas around Lunkaransar and Kolayat blocks of Bikaner District and Sujangarh of Churu district form a good aquifer.

The yield of open wells ranges from 0.05 to 0.66 lps, whereas in tube-wells it ranges between 0.29 and 0.69 lps.

Tertiary Sandstone

The Tertiary Sandstone is light brown, fine to medium grained and loosely consolidated, often intercalated with siliceous limestone, fuller's earth and clay. It has a maximum thickness of 300 m in the south-western part of Dungargarh block (Churu District) and the north-western part of Jaisalmer district. The sandstone is a porous formation and forms an aquifer of high potentiality.

The saturated thickness of the Tertiary Sandstone ranges from 80 m north of Bikaner to about 100 m near Kolayat village. Groundwater occurs under unconfined conditions. The specific capacity of tube-wells ranges from 1.00 to 7.81 lps/m.

Lathi Sandstone (Jurassic)

This sandstone is white-yellow or reddish brown in colour, intercalated with clay and siltstone. The sandstone is fine-grained in the upper part while the grain size

increases with depth. The maximum thickness of the aquifer has been found at Saraswati-I, drilled by WAPCOS for ONGC - more than 400 m.

The discharge of tube-wells ranges from 5.25 lps at Rama to 8.94 lps at Rajwai.

Vindhyan Sandstone

Vindhyan sandstone includes Nagaur sandstone and Jodhpur sandstone.

Nagaur sandstone is buff to reddish-brown sandstone, fine to medium grained, hard and compact, with intercalation of chocolate-coloured shale. It occupies large areas around Nokha and Kolayat blocks of Bikaner district and Dungargarh and Sujangarh blocks of Churu district.

Groundwater occurs under unconfined conditions. The thickness of the saturated zone ranges from 40 to 310 m. The yield of tube-wells ranges from 3.47 to 5.79 lps. This sandstone is permeable and forms a good aquifer.

Jodhpur Sandstone is generally red-brown to pink, fine to coarse-grained gritty sandstone. It is hard, compact and at places intercalated with Shales. It occurs in small areas around Sankara Block (Jaisalmer District) and forms a narrow, elongated strip around Sardarshahar, Ratangarh and Sujangarh blocks of Churu Districts.

Bilara Limestone

Bilara Limestone is grey to buff coloured, hard and compact dolomitic limestone, inter-bedded with shales and cherty bands. The limestone is cavernous in nature. It forms an aquifer in a small area around Sujangarh of Churu district. A tube-well drilled in Sandwa village in Sujangarh block of Churu district has a discharge of 1.08 lps with a drawdown of 8.5 m.

Granites

The granite is dark gray or pink in colour, fine to coarse grained with phenocrysts of feldspar. The overburden over top and underlying zones of fracturation yield water to wells and tube wells.

Rhyolite

The Rhyolite is reddish-brown, largely inter-stratified and massive. It is identified as an aquifer in very small areas around Sankra block (Jaisalmer District). Granites and Rhyolites are jointed and fractured in nature and recognized as low water yielding capacity aquifers.

Banded Gneissic Complex

Banded gneisses of Churu district in ACZ Ic have dual permeability character since these are both weathered as well as fractured rock aquifer units. Static water level (bgl) in these range from 36 to 40 m and have a yield potential by tube wells in the range of 1.67 lps to 4.60 lps for a draw down range of 8.60 m to 9.02 m.

1.4 Main Aquifer Units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Table1.4-1 Main Aquifer Units of ACZ I (c)

District	Block	Aquifer Units	Area (Km^2)

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 3 of Annex 2(b).

From the Table 1.5-1 it may be observed that explored depth of older alluvium aquifer unit of ACZ Ic ranges from 15m (Village Dhani Chilon, block Lunkaransar, district Bikaner) to 466m (Village Bandhau, block Sardarshahar, district Churu); SWL (bgl) from 0.81m (Village Rampur, block Nokha district Bikaner) to 104.50m (Village Adsar, block Dungargarh, district Bikaner) and well discharge from 0.17 lps (Village Rajasar, block Lunkaransar, district Bikaner) to 17.02 lps (Village and block Sardarshahar, district Churu).

In younger alluvium aquifer depth ranges from 58m (Village Khura, block Sujangarh, district Churu) to 556.60m (Village Lakhansar, block Dungargarh, district Bikaner); SWL (bgl) from 1.50m (Village Siyalo ki Basti, block and district Jaisalmer) to 90m (Village Lava, block Sam, district Jaisalmer) and well discharge from 1.67 lps (Village Borana, block and district Jaisalmer) to 18.33 lps (village Jaluwala, block and district Jaisalmer).

In Sedimentary aquifer the depth of aquifer ranges from 7.00m (Village Haboor, block and district Jaisalmer) to 613.40m (Village Mudh, block Kolayat, district Bikaner); SWL (bgl) from 0.60m (Village Ludarwa, block and district Jaisalmer) to 147m (Village Sanchoti, block Sam, district Jaisalmer) and well discharge from 0.14 lps (Village Ghotarn, block Sam, district Jaisalmer) to 64.32 lps (Village Chandan, block and district Jaisalmer).

In Hard-rock aquifer the depth of aquifer ranges from 24m (Village Dhan, block Sujangarh, district Churu) to 229.60m (Village Udrasar, block Sujangarh, district Churu); SWL (bgl) from 13m (Village Sankaria, block Sankra, district Jaisalmer) to 50.66m (Village Udrasar, block Sujangarh, district Churu) and well discharge from 0.28 lps (Village Baiya, block Sankra, district Jaisalmer) to 5.67 lps (Village Sankaria, block Sankra, district Jaisalmer).

1.6 Sub-Surface Geology

Hydrogeological cross – section A-A' (Sadewala- Thindesar)

The cross – section A-A' (Figure 1.6-1) has been drawn from Sadewala villages in extreme north – western part of the ACZ to Thindesar village in the extreme north – eastern part of the Agroclimatic Zone. Total length of the cross – section is 365 kms. The ground level elevation ranges from RL 95 meters (Sadewala) to RL 313 meters (Thindesar) above mean sea level. The cross – section reveals that the thickness of older alluvium of Quaternary age ranges from 15 meters (Thindesar) to 65 meters (Sadewala). It comprises fine to coarse sand with clay and kankar. In eastern part of the cross – sectional area alluvium is comprised of well sorted sediments with medium to coarse grained sand. The western part is limited to fine grained sand. In major part of the cross – sectional area alluvium is underlain by Tertiary Sandstone except in extreme eastern part where alluvium is underlain by Bilara Limestone of Marwar Super Group (Thindesar). Tertiary Sandstone has intercalation of Shale around Nokhra and Girjasar villages. Water level ranges from 42 meters below ground level (Sadewala) to 114 meters below ground level (Bhane ka Gaon).

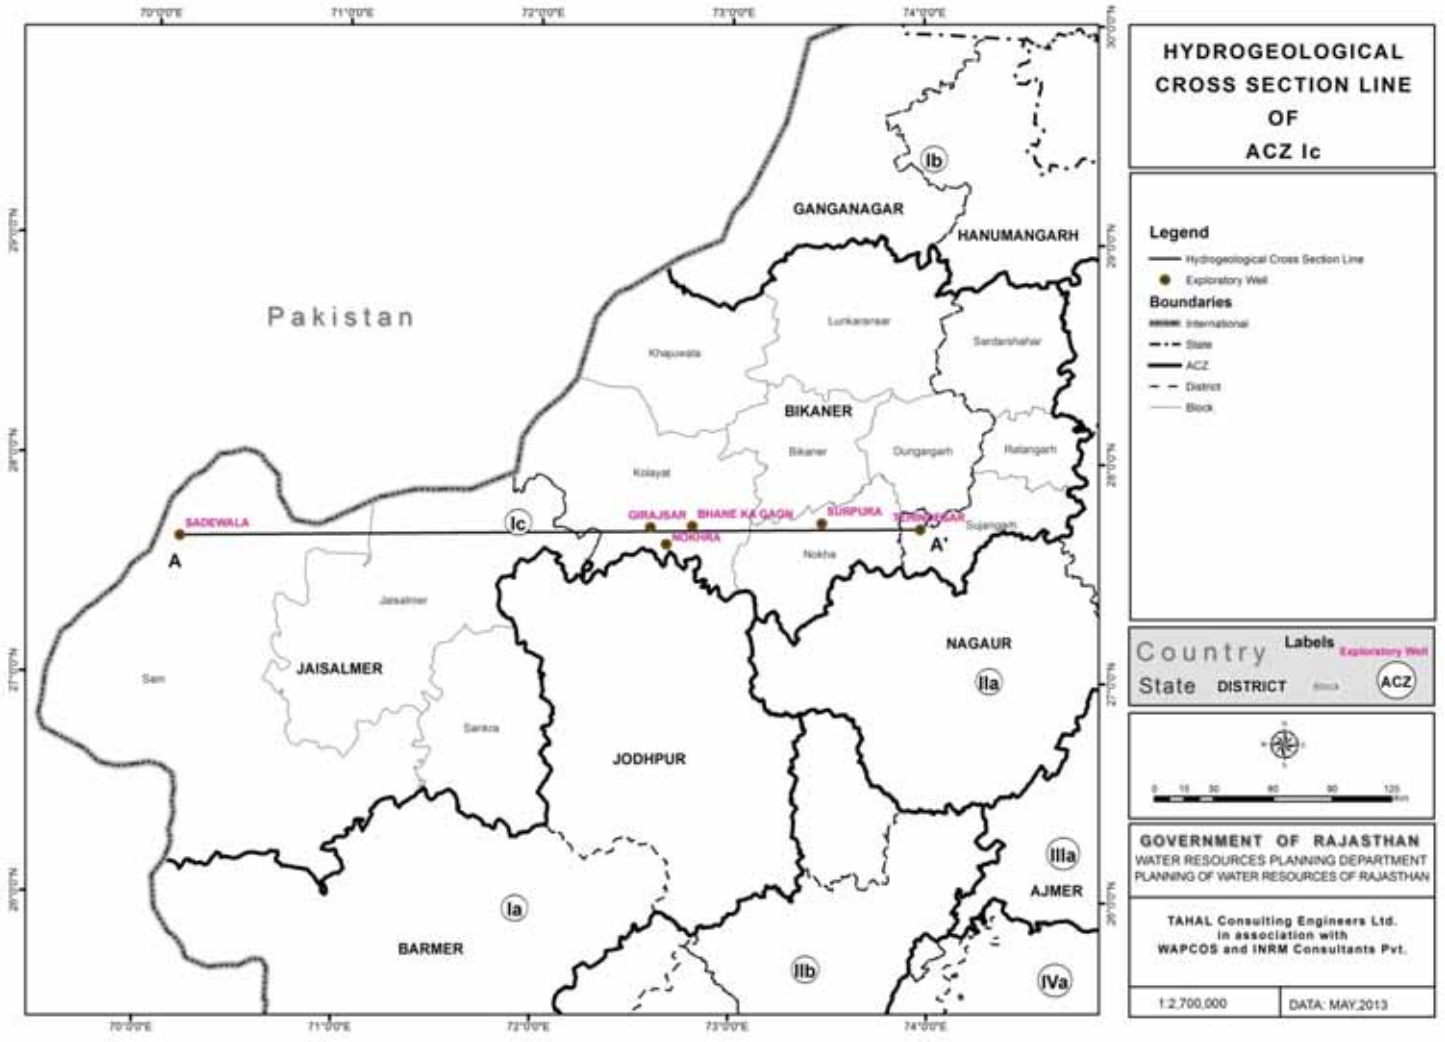

Figure 1.6-2 Hydrogeological cross-section (Sadewala- Thindesar)

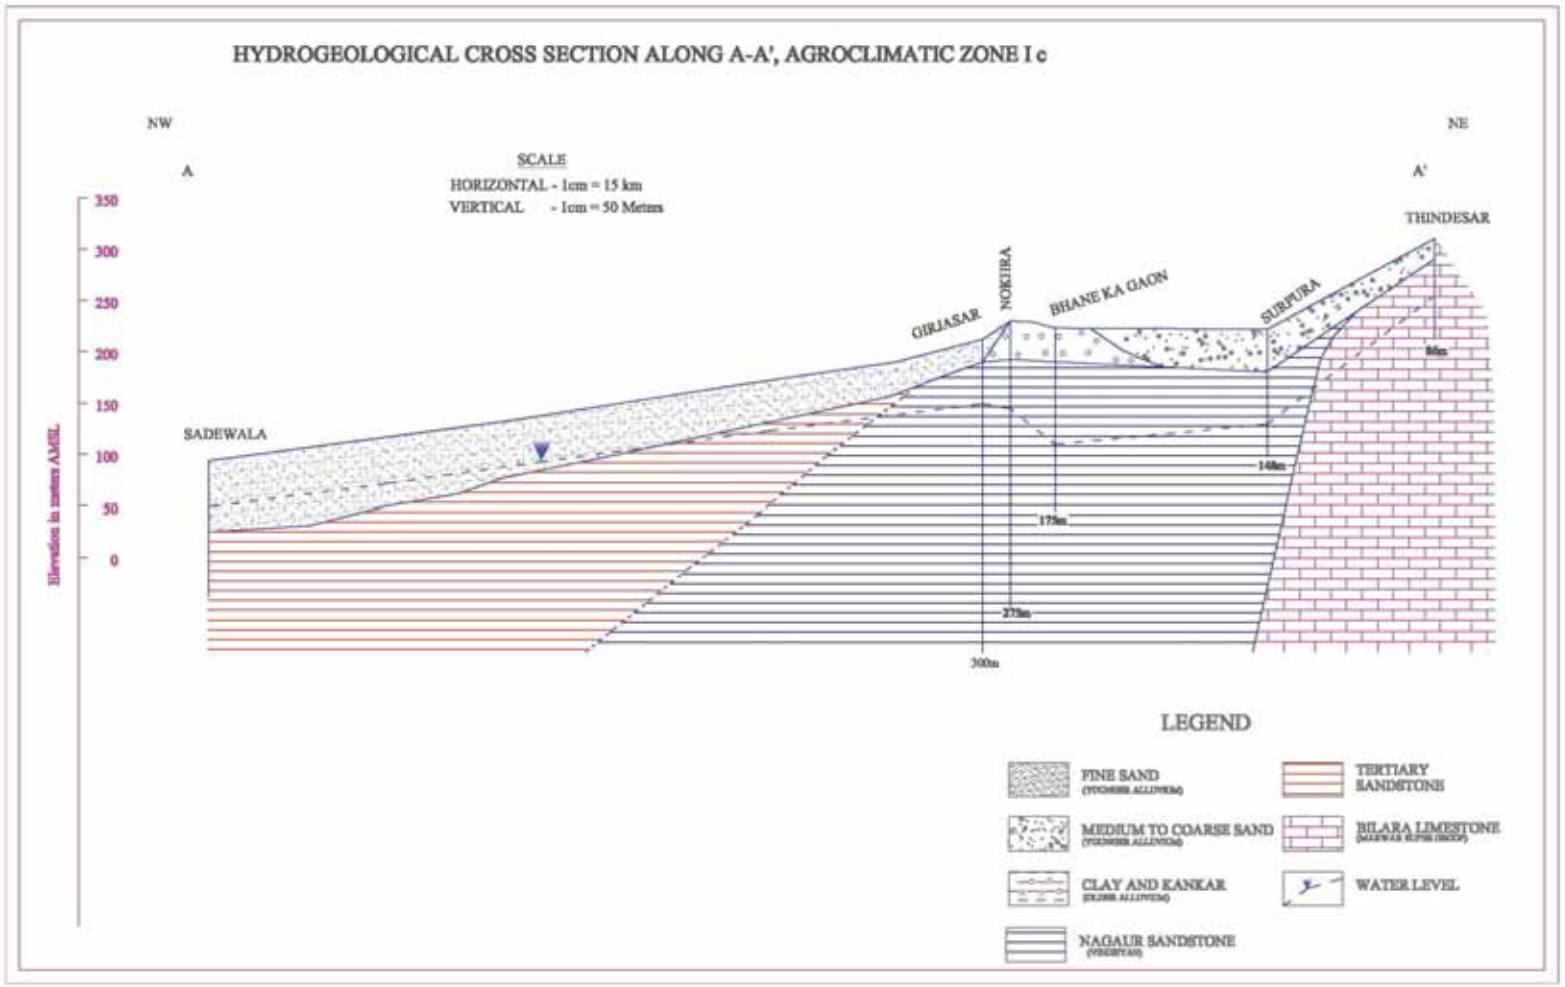

Source: - CGWB and RGWD

1.7 Depth to Groundwater

In this ACZ, as may be seen from pre-monsoon (2010) groundwater table map (Drawing No. ACZ I(c)-003), the groundwater levels have range from 5 to 120 m (bgl)both in eastern part of ACZ occupied by Bikaner district and in western part of ACZ occupied by Jaisalmer district. Nearly 50% area of ACZ in occupied by deep groundwater levels of 60-100 m depth range.

Practically no change in post-monsoon map of 2010 (Drawing No. ACZ I(c)-004) is noticeable in view of general deep groundwater levels in the area, except locally in Jaisalmer and Sankra blocks of Jaisalmer district, where rise in levels is noticeable.

1.8 Groundwater Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ I (c) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-Wise/Aquifer-Wise Fluctuation in Levels of Groundwater ACZ I(c)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)

ACZ Ic Summary			**421**	**-5.50**	**10.55**	**0.45**

Source: - CGWB and RGWD

The average ground water level fluctuation in the ACZ for older alluvium ranges from – 0.22 m in Ratangarh block of Churu district to 0.25 m in Dungargarh block of Bikaner district. The average fluctuation in younger alluvium ranges from 0.10m in Sujangarh block of Churu district to 0.68 m in Sam block of Jaisalmer district. In sedimentary aquifers the average fluctuation ranges from -0.69 m (Vindhyan Sandstone) in Sujangarh block of Churu district to 3.50 m (Tertiary Sandstone) in Sankra block of Jaisalmer district. In hard rock aquifers, the average fluctuation ranges from 0.40 m (Phyllite /Schist) in Sujangarh block of Churu district to 2.86 m (Jalore Granite) in Sankra block of Jaisalmer district.

1.9 Groundwater Levels and Flow Directions

The major part of this ACZ is within the Outside Basin, except a very small portion of the Luni River Basin, the Sankra block, in the south (Figure 8.3). This ACZ area is devoid of any expressive surface drainage systems but there are some inner drainage phenomena such as the brackish lake of Lunkaransar, or the Ager Ka Rim in the Phalodi area in the south west, having interesting sub-recent to recent sedimentary and precipitation history. The area is drained, therefore, by means of groundwater outflow in the northwest and, in the southwest, towards Barmer district (Groundwater table contour map ACZ (Ic) 002)

The operative aquifers within this ACZ are the Older and Younger Alluvium, the Jurassic, Vindhyan and Tertiary Sandstones, Limestone and Bilara Limestone. Outcrops of Rhyolite, Gneisses (B.G.C.) and Jalore Granite are also encountered in the area (Map ACZ I(c) 001).

The groundwater hydraulic gradients are rather minor, about 1 – 1.5 m per km. In the north, within Bikaner district, the blocks of Khajuwala, Kolayat, Bikaner and Lunkaransar, the gradient is almost flat, less than 0.5m per km.(Map ACZ Ic-002) This is most probably a consequence of the huge losses from the IGNP canals and distributaries there, obliterating the natural groundwater flow pattern within the alluvial aquifers there, which is invariably of rather moderate gradient. The very small gradient in the non-alluvial formations may point to high values of aquifer Transmissivity and/or thick profile of water bearing layers and, more than likely, a rather poor extent of replenishment/groundwater flow. The positive implication of

this configuration is that the groundwater losses by means of outflow to the area across international border are rather meager.

Depth to groundwater level varies between about 10–20m bgl in the north, Lunkaransar block to 100m bgl and over along the east – west chain of Ratangarh, Dungargarh, Bikaner and Kolayat blocks, the deepest reported groundwater level in Rajasthan, along with the recorded figures from the Sheo and Barmer blocks in the west (Map ACZ Ic-003). These reported water level records are typical to the sedimentary (sandstone and limestone) aquifers west of the Aravali, where the favourable Transmissivity values and the thick operative profile may support and maintain deep drilling and highly productive tube-wells. East of the Aravali this configuration does not exist and the operative aquifers, mainly alluvial and upper, weathered mantle of different formations that are otherwise impervious to semi impervious, are rather thin. This remark may also be applied to the issue of static reserves, which are on its face value, enormous in western Rajasthan and not that impressive west of the Aravali.

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ I(c) are shown in Figure 1.10-1 to 1.10-12. The supportive data for the same is given in Annex 9.

1.10.1 Jaisalmer District

The Pre-monsoon average groundwater levels in Jaisalmer district in the year 1984 vary between a minimum of 96.82 m amsl in (Sam block) and maximum of 213.39 m amsl in (Sankra block) while in the year 2010 the Pre-monsoon average ground water level vary between a minimum of 99.52 m amsl (Sam block) and a maximum of 213.31 m amsl (Sankra block). Long-term groundwater levels are presented per block in Figures 1.10-1 – 1.10-3 and the level change rates in Table 1.10-1. All blocks show relatively similar rising rates of groundwater of approximately 0.1 m/yr. The district is characterized with low rain depth, very low draft per area ratio (less than 0.015 $Mm^3/yr/km^2$; Figure 8.8) and almost no difference between the pre and post-monsoon groundwater levels. The groundwater levels rise is mainly attributed to huge amounts of water that infiltrates from the IGNP.

1.10.2 Churu District

The Pre-monsoon average groundwater levels in Churu district in the year 1984 vary between a minimum of 196.97 m amsl (Sardarshahar block) and maximum of 297.04 m amsl (Sujangarh block) while in the year 2010 the Pre-monsoon average ground water level vary between a minimum of 198.39 m amsl (Sardarshahar block) and a maximum of 292.33 m amsl (Sujangarh block). Long-term groundwater levels presented per block in Figures 1.10-4 – 1.10-6 and the level change rates in Table 1.10-1. Churu district is affected by two major contradicting water systems:

1) Intensive draft in Nagaur and Sikar districts on the south and east (ACZ IIa).
2) Huge amounts of water that leaches from the IGNP and recharges the aquifers from Hanumangarh District in the north and from the eastern side of Churu District. The result is that Sujangarh and Ratangarh blocks are characterized with long-term decreasing groundwater levels (-0.15 m/yr in

pre monsoon) whereas Sardarshahar block at the north is characterized with long-term stable groundwater levels (+0.03 m/yr). These trends are stable in all three blocks.

1.10.3 Bikaner District

The Pre-monsoon average groundwater levels in Bikaner district in the year 1984 vary between a minimum of 116.69 m amsl (Khajuwala block) and maximum of 219.12 m amsl (Nokha block) while in the year 2010 the Pre-monsoon average ground water level vary between a minimum of 124.32 m amsl (Khajuwala block) and a maximum of 217.28 m amsl (Nokha block). Long-term groundwater levels are presented per block in Figures 1.10-7 – 1.10-12 and the level change rates in Table 1.10-1. Rain depth is relatively low with almost no difference between pre and post monsoon seasons. The northern and eastern blocks of Bikaner District (Lunkaransar, Khajuwala and Kolayat) are strongly affected by the IGNP, thus have a constant long-term rising groundwater levels. In these blocks the draft are relatively low (less than 0.015 $Mm^3/yr/km^2$; Figure 8.8) and together with the massive artificial infiltration the stage of development is below 50%. The south-western blocks (Dungargarh and Nokha) are also affected by the IGNP but also by intensive draft from the south and east in ACZ IIA and from larger draft performed within the blocks (0.015-0.03 $Mm^3/yr/km^2$;). Bikaner Block, which is located in the middle of ACZ Ic is affected by both IGNP and the massive draft and presents close to stable groundwater levels.

Based on the long-term water level trends, future water levels have been predicted for pre and post monsoon and accordingly prediction of dry monitoring wells has been done and presented in Table 1.10-2.

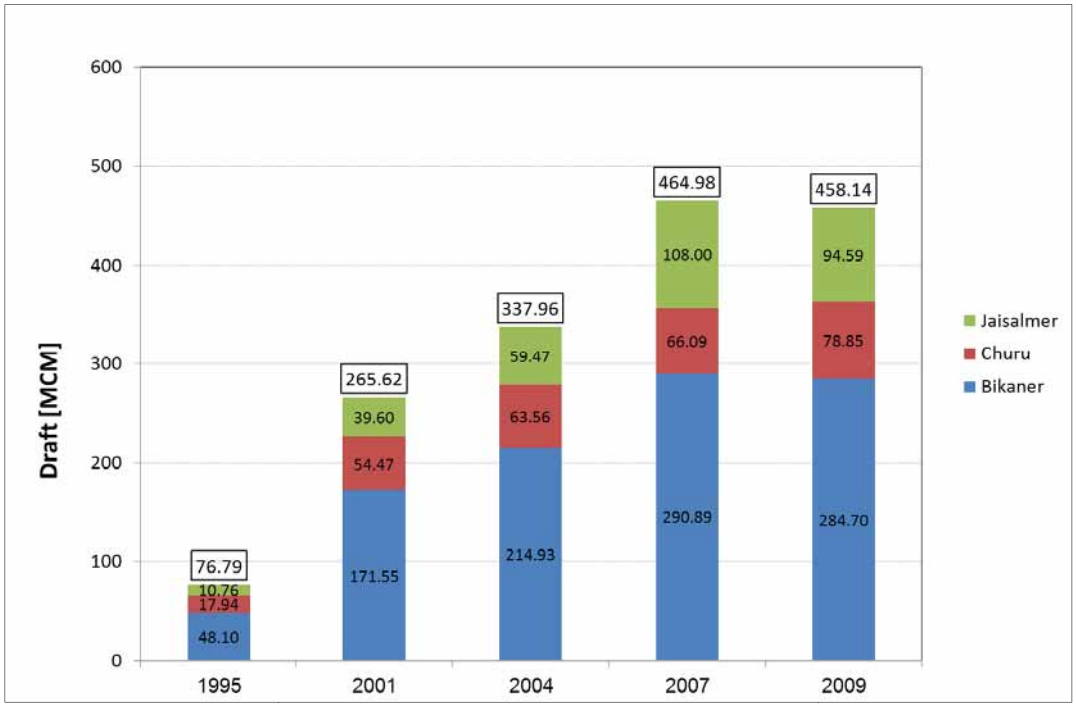
1.11 Long-Term Drafts

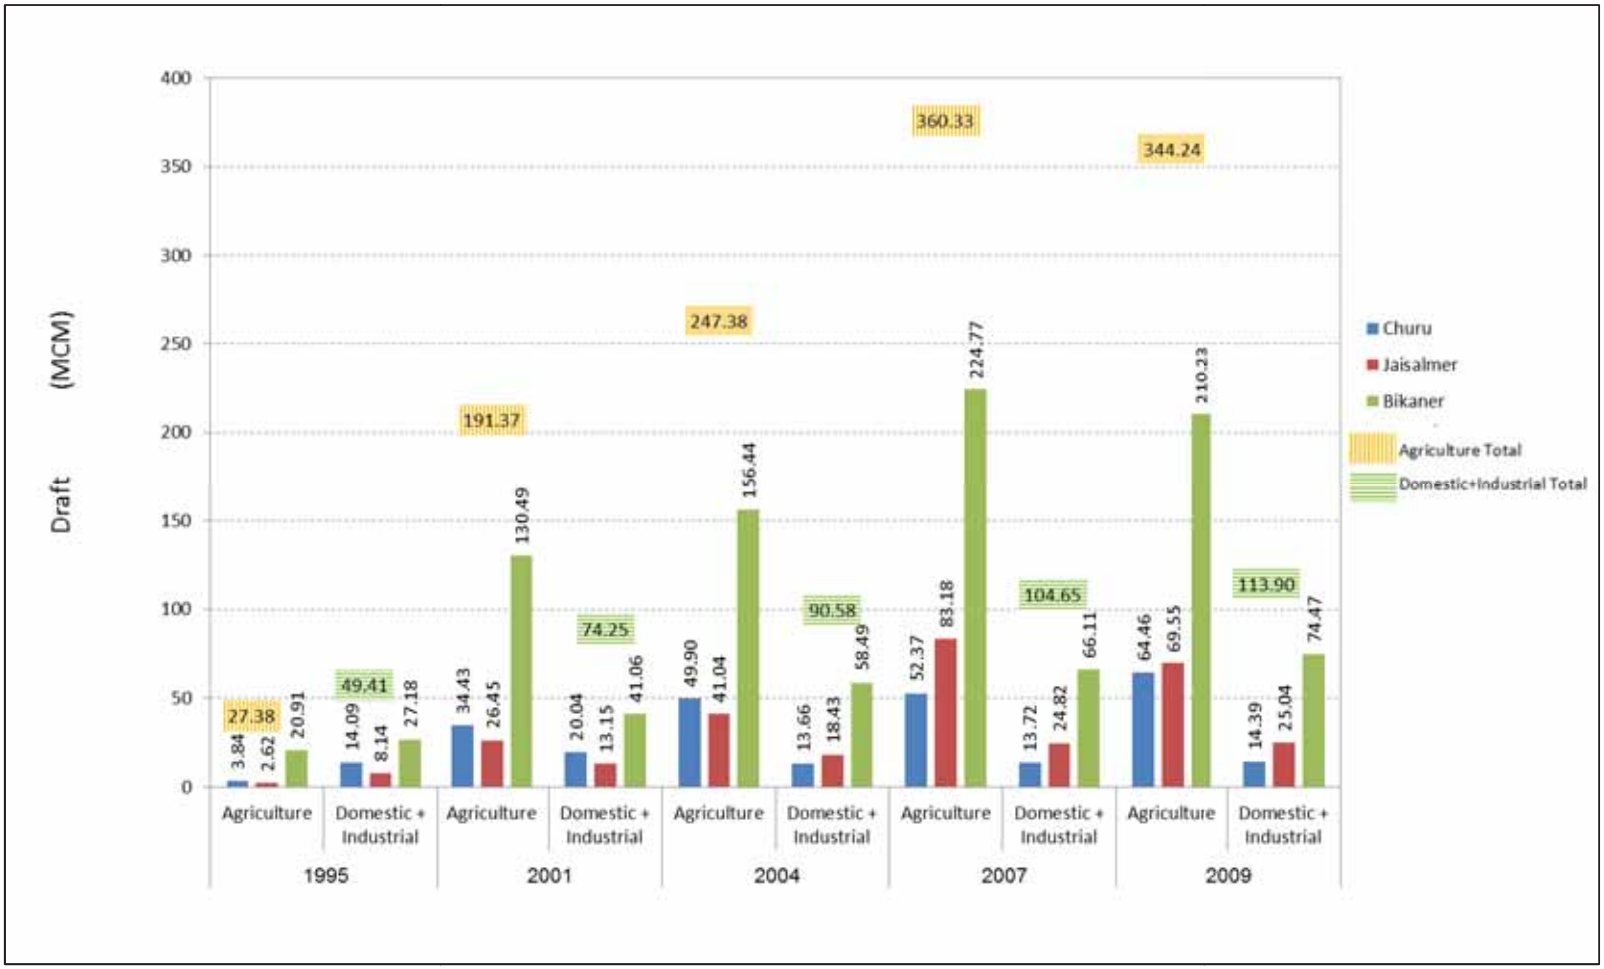
Groundwater draft in ACZ I(c) increased dramatically from 77 Mm^3 during 1995 to 458 Mm^3 during 2009 (Figure 1.11-1, Table 1.11-4). Between 2007 and 2009 the total draft remained similar. The draft per unit area is relatively low since it is located in the sparsely populated area. Generally, most of the groundwater is used for irrigation comprising between 71% - 74% of the total draft (Table 1.11-4). However, during 1995 most of the groundwater volume was used for domestic & industrial purposes. Bikaner District is the main consumer with an average of 67% out of the total draft in the ACZ (Figure 1.11-1, Table 1.11-4).

Figure 1.11-1 Total Groundwater Draft for All Uses in ACZ Ic by Districts (1995-2009)



Source: CGWB and RGWD

Figure 1.11-2 Groundwater Draft for Agriculture and Other Uses in ACZ I(c) by Districts



Source: CGWB and RGWD

1.11.1 Churu District

Groundwater draft in Churu District comprises ~18% out of the total draft within ACZ I(c). Throughout the examined time period the draft ranges between 18 Mm^3 (0.002 Mm^3/km^2) during 1995 and 79 Mm^3 (0.010 Mm^3/km^2) during 2009 – an overall relative rise of 340% (Figure 1.11-1, Table 1.11-4). The most productive block is Sujangarh with approximately twice the volume of each of the two other blocks and almost half of the total volume in the district (Figure 1.11-3, Table 1.11-4). In all three blocks most of the groundwater (60%-87% with an average of 73%) are being used for agriculture (Figure 1.11-2, Table 1.11-4).

Table 1.11-1 Total Change in Groundwater Draft - Churu District (within ACZ Ic) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Ratangar	>+500%	-24%	+157%
Sardarshhar	>+500%	+17%	+185%
Sujangarh	>+500%	+30%	>+500%

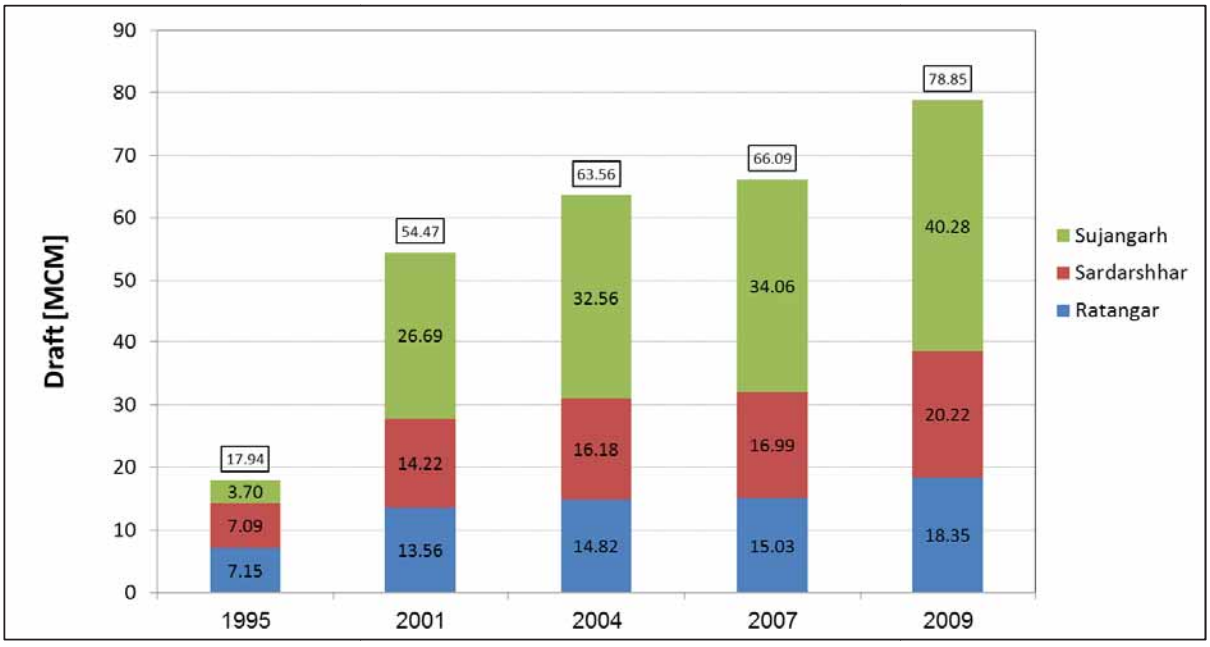
Figure 1.11-3 Total Groundwater Abstraction in Churu District (within ACZ Ic) by Blocks



Source: CGWB and RGWD

1.11.2 Jaisalmer District

Groundwater draft in Jaisalmer district comprises 19% out of the total average of the whole examine period, and 21% during 2009. Throughout the examined time period the draft ranges between 11 Mm^3 (less than 0.001 Mm^3/km^2) during 1995 and 95 Mm^3 (0.002 Mm^3/km^2) during 2009 – a total rise that is larger than 500%. The main productive block is Jaisalmer with 52% out of the total draft during 2009, and its draft per unit area is also the highest within the district (Figure 1.11-4). In the Jaisalmer and Sankra Blocks most of the groundwater (78% and 81% respectively) is being used for agriculture, whereas in Sam Block only 35% is being used for agriculture and the rest serves for domestic & industrial uses (Figure 1.11-2, Table 1.11-4).

Table 1.11-2 Total Change in Groundwater Draft - Jaisalmer District (within ACZ Ic) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Jaisalmer	>+500%	+197%	>+500%
Sam	>+500%	+227%	+424%

1.11.3 Bikaner District

Groundwater draft in Bikaner district comprises (on average)~63% of the total draft in the ACZ. Throughout the examined time period the draft ranges between 48 Mm^3 (0.002 Mm^3/km^2) during 1995 and 285 Mm^3 (0.009 Mm^3/km^2) during 2009 – an overall relative rise of 492% (Figure 1.11-1) Between 2001-2007 the main productive block was Nokha (~35% of the total average volume in the district). During 2009 groundwater draft in Dungargarh block exceeded Nokha block with 126 Mm^3 (Figure 1.11-4). In all of the blocks the main usage of groundwater is for agriculture comprising 58%-82%, whereas the rest is being used for domestic & industrial purposes (Figure 1.11-2, Table 1.11-4).

Table 1.11-3 Total Change in Groundwater Draft - Bikaner District (within ACZ Ic) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bikaner	>+500%	+100%	+338%
Dungargarh	>+500%	+439%	+586%

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 1961 villages in ACZ I (c), 407 are found suitable for drinking water use, 494 for irrigation use and 1469 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in groundwater is summarised in Table 1.12-1.

Table 1.12-1 Village and Block Wise Water Quality

Source: - CGWB and RGWD

It may be seen from above that out of 1961 villages of ACZ Ic, 187 fall under desirable, 1180 under maximum permissible limit and 594 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 784 while number of villages with maximum permissible limit of use is 266 and number of above maximum permissible limit for Fluoride is 911. As regards presence of nitrate in ground water, 426 fall under highest desirable limit of less than 45 mg/l and 479 under maximum permissible limit along with 1056 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 485 villages fall under maximum permissible limit and 1467 under above maximum permissible limit of 2250 microhos/cm and 9 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

Groundwater Quality of ACZ I (c) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ I(c) is shown in Drawing No. ACZ I(c)-005. Large part of ACZ is occupied by groundwater of medium quality with chloride concentration in the range of 250-1000 mg/l. High levels of chloride with concentration beyond 1000 mg/l in groundwater of ACZ occur in Bilara limestone and Phyllite/schist aquifer units of Ratangarh block of Churu district; Tertiary sandstone aquifer unit of Sardarshahar block of Churu district and Younger alluvium aquifer unit of Sam block of Jaisalmer district along with some isolated pockets in different areas of the ACZ. Potable groundwater of less than 250 mg/l of chloride occurs in parts of the blocks of Sardarshahar of Churu district, Dungarpur, Bikaner and Nokha blocks of Bikaner district occupied by Alluvium and Tertiary sandstone aquifers.

Block-wise / aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in the Table 1.12-2.

Table 1.12-2 Percent area occupied with various level of Chloride in ground water of ACZ I (c)

Source: - CGWB and RGWD

From the table it can be seen that only 14% area of Bikaner district, 7% of Churu and 3% of Jaisalmer district that comprise the ACZ I (c) bear fresh groundwater with chloride level being less than 250,mg/l. The remaining area bears high concentration chloride-rich groundwater of 250 to 1000 mg/l and beyond1000 mg/l values. 100% areas of non-potable groundwater related to presence of chloride in groundwater belong to Bilara Limestone aquifer unit and Phyllite/Schist aquifer unit of Ratangarh block of Churu district.

Groundwater Quality of ACZ I (c) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ I(c) is shown in Drawing No. ACZ I(c)-006. The northern part of ACZ occupied by alluvium and sandstone aquifers and southern part by sandstone and basalt rock units bears high nitrate level groundwater of >100 mg/l concentrations. The remaining area of Bikaner and Jaisalmer district occupied with different aquifer units possess relatively fresh groundwater with concentrations of NO_3 between below 45 mg/l to 100 mg/l.

Block-wise / aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

Table 1.12-3 Percent area occupied with various level of Nitrate in ground water of ACZ I (c)

Source: - CGWB and RGWD

In ACZ I (c), as may be seen from the table as above, a very small area of 14% in Bikaner district, 9.6% in Churu district and 33.7% in Jaisalmer district is occupied with potable quality groundwater and the remaining area is covered by levels beyond the limits of drinking water use. In Churu district, Bilara Limestone and Phyllite/Schist aquifer units of Ratangarh block are having 100% area with Nitrate content that exceeds 100 mg/l.

Groundwater Quality of ACZ I (c) by fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ I(c) is shown in Drawing No. ACZ I(c)-007. From map, it may be seen that a large area in western part of ACZ occupied with different aquifer units in Jaisalmer district in

western part of ACZ and northern part of the ACZ in Bikaner district is served with non-potable quality groundwater with fluoride concentration exceeding 1.5 mg/l. Potable quality groundwater of <1.5 mg/l concentration occurs in Tertiary sandstone, Bilara limestone and Phyllite/Schist aquifer units in eastern part of ACZ in various parts of the blocks of Churu and Bikaner districts.

Block-wise / aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

Source: - CGWB and RGWD

From above table it can be observed that 56.44% area of the ACZ contain poor quality ground water with fluoride level of >1.5 mg/l. The 100% area occupied in Older alluvium aquifer unit of Bikaner block of Bikaner district; Bilara limestone aquifer unit of Jaisalmer and Sankra block of Jaisalmer district; Older alluvium

aquifer unit of Sankra block of Jaisalmer district bear Fluoride rich non-potable water with fluoride content exceeding 1.5 mg/l.

Groundwater Quality of ACZ I (c) by EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ I(c) is shown in Drawing No. ACZ I(c)-008. Excepting parts of the blocks of Dungargarh, Bikaner, Nokha, that bear low salinity groundwater of <2250 micromhos/cm concentration, the remaining western, northern parts of Bikaner and Jaisalmer districts occupied with Alluvium, Sandstone, Limestone and Rhyolite units bear high salinity groundwater with range of 2250-5000 micromhos/cm and beyond it.

Block-wise / aquifer-wise percent area occupied with various levels of EC in groundwater of ACZ is shown in Table 1.12-5.

Table 1.12-5 Percent area occupied with various level of EC in ground water of ACZ I (c)

Source: - CGWB and RGWD

It can be seen from the table that Younger Alluvium aquifers units and Tertiary sandstone of Khajuwala block; Older alluvium and Phyllite/Schist aquifer units of Ratangarh block of Churu district; Bilara limestone of Jaisalmer and Sankra blocks of Jaisalmer district bear high salinity ground water in the range of 2250 to 5000 micromhos/cm.

1.12.3 Long-term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ I(c) are shown in Figure 1.12-1 to 1.12-24. The supportive data for the same is given in Annex 10.

a) Jaisalmer District

Average chloride and EC concentrations per block for the period 1984-2009 are presented in Figures 1.12-1 to 1.12-5 (odd figures). The graphs demonstrate well the good correlation between the two parameters in most of the blocks. Jaisalmer district is presenting the highest chloride concentration in the ACZ while average chlorides fluctuate within the range of 600 to 1,200 mg/l. Yet Long-term trends of most of the area show a declining trend. At the eastern and middle part of the district around Sankra and Jaisalmer blocks, average concentrations drop from a maximum of ~1,200 mg/l (above the permissible limit for drinking) in 1990-1992 to ~800 mg/l during 2010, an average decline rate of ~15 mg/l/y. At the western part of the district around Sam block concentrations keep high and relatively stable over time with a moderate average increase of 6 mg/l/y.

EC trends follow closely the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly between 3,000 and 6,000 µS/cm; higher than the permissible limit for drinking. Variance along the district is low and the average value is relatively constant around 4,000 µS/cm. However, maximum concentrations of up to 6,000 µS/cm were recorded in Sankra and Jaisalmer blocks, similarly to Cl, in the early nineties of the least century. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ I(c)-009.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figure 1.12-2 to Figure 1.12-6 (even figures). Average NO_3 concentrations in most blocks are between 100 and 200 mg/l; higher than the permissible limit for drinking (100 mg/l). Peak values were recorded in Jaisalmer block and reach 400 mg/l (1999-2000). The long-term trend is stable around 200 mg/l in all blocks.

Fluoride concentrations are presented in Figure 1.12-2 to Figure 1.12-6, along with the nitrates. In most of the district area concentrations are relatively homogeneous and fluctuate between 1-4 mg/l. Nonetheless, in the northeast part of the district in Jaisalmer block, there is a patch of extreme fluoride concentrations. In this area

concentrations reach above 7 mg/l. These values are five times higher than the maximum permissible values for drinking (1.5 mg/l) and are exceptional at the state level in general and in this area in particular.

b) Churu District

Only 3 blocks in the western part of this district are found within ACZ Ic: Sujangarh, Sardarshahar and Ratangarh. Average chloride and EC concentrations per block for the period 1984-2009 are presented in Figures 1.12-7 to 1.12-11 (odd figures). The graphs demonstrate well the good correlation between the two parameters. Average concentration fluctuated between 350 mg/l to 1,200 mg/l. At the northern part of the district around Sardarshahar and Ratangarh blocks chloride concentration are higher and there is a significant increase along the years. Average values rose from below 400 mg/l (Ratangarh block) at 1984 to a peak of almost 1,200 mg/l in 2003-2004, an average growth rate of >15 mg/l/y. However, at the southern part of the district around Sujangarh block, chloride concentrations are stable over the years slightly above ~600 mg/l and recorded a negligible increase in a rate of 1 mg/l/y.

EC trends follow the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly between 2,000 and 6,000 µS/cm; above the permissible limit for drinking. Relatively low concentrations were recorded in Ratangarh and Sujangarh blocks (2,000 to 4,000 µS/cm) while higher (average) concentrations are observed, similarly to Cl, in Sardarshahar block, in which concentration exceed 5,000 µS/cm in most of the years. In general, EC trends are more homogenous spatially and the long-term trends are more moderate. In fact Sardarshahar block presents a moderate decline trend of ~55 µS/cm/y.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figures 1.12-8 to 1.12-12 (even figures). Average NO_3 concentrations vary widely between below 200 to above 600 mg/l; higher than the permissible limit for drinking (100 mg/l). Peak values were recorded in Sardarshahar block and reach 650 mg/l (1993-1994). Nitrate values in this district are relatively high compared to the rest of the ACZ but are still not unusual for this part of the state.

Fluoride concentrations are presented in Figures 1.12-8 to 1.12-12, along with the nitrates. Concentrations are relatively homogeneous in space and time. In general, concentrations in the district fluctuate between 1-3 mg/l. In most blocks, most of the time, F levels are around the permissible limit for drinking (1.5 mg/l). Ratangarh and Sardarshahar blocks present the lowest average levels in the district which reach as low as ~0.8 mg/l. Sujangarh block displays high values, reaching above 3 mg/l in 1984-1985. In all blocks a moderate and consistent decrease in concentrations took place with an average rate of 0.02 mg/l/y.

c) Bikaner District

Average chloride and EC concentrations per block for the period 1985-2009 are presented in Figures 1.12-13 to 1.12-23 (odd figures). The graphs demonstrate well the good correlation between the two parameters. Long-term trends of average chlorides fluctuate widely within the range of 200 to 1,200 mg/l. However, average concentrations vary between a minimum of ~200 mg/l in Dungargarh and Bikaner blocks at the southeastern part of the district to a maximum of ~1,200 mg/l (above the permissible limit for drinking) in Kolayat block at the western part of the district. Kolayat block recorded a gradual increase along the years from a minimum of 600 mg/l in 1986 to a close to stable value of above 1,200 mg/l since 2006, an average growth rate of >15 mg/l/y. At the other blocks values keeps stable around 400-600 mg/l. The extreme conditions in Kolayat block are attributed mainly to 2 factors: (1) due to shallow water table around 10-20 m bgl the aquifer is more vulnerable to return flows from irrigation and canals (2) the main formation in this part of the district is older alluvium, in contrast to the carbonate aquifers that characterize the other parts of the district.

EC trends follow the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly between 2,000 and 8,000 µS/cm in all blocks except for Kolayat block with values above 12,000 µS/cm. Similarly to Cl trends, EC concentrations are usually stable except for Kolayat values. In Kolayat block a place sharp increase was recorded from <4,000 µS/cm at 1985 to >12,000 µS/cm at 1988, a total rise of ~8,000 µS/cm within three years.

Average NO_3 and F levels per block for the period 1985-2009 are displayed in Figures 1.12-14 to 1.12-24 (even figures). Average NO_3 concentrations in most blocks are between 50 and 400 mg/l (the permissible limit for drinking is 100 mg/l). Peak values were recorded in Khajuwala block at the northern part of the district and reach 550 mg/l (1986). At the southern part of the district around Nokha district relatively stable values were recorded over the years. These values are located at the margins of a large nitrate plume found in the northwestern end of the Jodhpur district likely caused as a result of return flows from irrigation.

Fluoride concentrations are presented in Figure 1.12-14 to figure 1.12-24, along with the nitrates. In general, concentrations in the district fluctuate between 1-4 mg/l. In most blocks, most of the time, F levels are slightly above the permissible limit for drinking (1.5 mg/l) and there is moderate decline trend in all blocks. Still in Khajuwala and Nokha blocks values are relatively high and exceed 5 mg/l. These high concentrations are similar to the high concentrations of nitrate in those blocks, although fluoride pollution sources are non-anthropogenic and apparently have no relation to the shallow groundwater.

5	Phyllite & Schist	C_3S_2	High Salinity & Medium Sodium

S. No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
5	Phyllite & Schist	C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
6	Rhyolite	C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
7	Tertiary Sandstone	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
8	Vindhyan Sandstone	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
9	Younger Alluvium	C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium

It can be seen from the Table No. 1.13-1 that out of the 9 aquifer units of ACZ, High salinity and low sodium to high salinity and very high sodium class water occur in Bilara limestone, Jalore granite, limestone, Tertiary sandstone and younger alluvium units.

High salinity and low sodium to very high salinity and very high sodium occur in Jurassic sandstone aquifer. Medium salinity and low sodium to very high salinity and very high sodium classes of water exist in Vindhyan sandstone and Tertiary sandstone units of ACZ.

As may be seen from classification of irrigation water map (Drawing No. ACZ I(c)-009) of ACZ I (c), the excellent and good class irrigation water occur in eastern and in isolated pockets in western and northern parts of ACZ and remaining part of the ACZ bear high salinity and high sodium water ($C_4 S_1$ to $C_4 S_4$).

1.14 Groundwater Draft Village-Wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ I(c). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Groundwater Abstractions in ACZ I (c)

Source: Village wise Data of Tehsil, CGWB and RGWD

It may be seen from the above Table that total abstraction for all uses in ACZ Ic is 587.59 Mm^3 which include 494.32 Mm^3 as gross agriculture draft and 93.27 Mm^3 as gross domestic and industrial draft.

A total of 363.39 Mm^3 are abstracted from Bikaner district part of the ACZ which include 300.80 Mm^3 as agriculture draft and 62.59 Mm^3 as domestic & Industrial. A maximum abstraction has taken place in Nokha block which amount to 140.42 Mm^3 and minimum 11.26 Mm^3 abstraction have occurred in Lunkaransar block. Among aquifer units maximum abstraction of 108.85 Mm^3 are obtained from Tertiary sandstone unit in Bikaner block of Bikaner district.

In Churu district Part of the ACZ total 89.17 Mm^3 of ground water is abstracted which include 69.99 Mm^3 as agriculture draft and 19.18 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Sujangarh block which amount to 204.11 Mm^3 and minimum 23.29 Mm^3 abstraction have occurred in Sardarshahar block. Among aquifer units, maximum abstraction of 22.85 Mm^3 are obtained from Bilara Limestone sandstone units in Sujangarh block of Bikaner district.

In Jaisalmer district part of the ACZ total 135.03 Mm^3 of ground water is abstracted which include 123.53 Mm^3 as agriculture draft and 11.50 Mm^3 as domestic and industrial draft. A maximum extraction has taken place in Jaisalmer block which amount to 56.03 Mm^3 and minimum 27.86 Mm^3 abstraction has taken place in Sam block. Among aquifer units maximum abstraction of 55.62 Mm^3 are obtained from Jurassic sandstone unit in Jaisalmer block of the district.

1.15 Static Groundwater Resources

1.15.1 Static Groundwater Resource (Fresh Groundwater)

The fresh static groundwater resources of ACZ I (c) for year 2010 are given in Table 1.15-1.

Source: - CGWB and RGWD
Note: - Zero availability means negligible value

The assessed static ground water resources (Saline) of the ACZ amount to 18,513.90 Mm^3 out of which 13,062.46 Mm^3 are present in Jaisalmer district, 4,908.96 Mm^3 in Bikaner district and 542.48 Mm^3 in Churu district of the ACZ. Of the various aquifer units Tertiary sandstone of Jaisalmer block of Jaisalmer district with 2,956.53 Mm^3; Younger alluvium of Sam block of Jaisalmer district with 2,808.83 Mm^3 and older alluvium of Khajuwala block of Bikaner district, with 2,110.09 Mm^3 are having maximum saline static resource with respect to aquifer units.

1.16 Dynamic Groundwater Resources

1.16.1 Dynamic Groundwater Resource (Fresh Groundwater)

The assessed net availability of dynamic groundwater resource, groundwater abstraction for all type of uses, the stage of groundwater development and category of development block for the ACZ for year 2010 is shown in Table 1.16-1.

Table 1.16-1 Fresh Dynamic Groundwater Resources (2010) of ACZ I (c)

ACZ Ic Total			**456.54**	**587.59**	**128.71**	**Over Exploited**

Note: Zero availability means negligible value

It may be seen from the table that net groundwater availability in the ACZ is assessed as 456.54 Mm^3 and draft for all type of uses as 587.59 Mm^3. This works out the stage of groundwater development in ACZ as 128.71 % giving the zone a Over-Exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ I(c) showing the

categorization of villages according to ground water development is shown in Drawing No. ACZ I(c)-010.

Of the total 11 blocks of ACZ, 6 blocks are categorised as groundwater over-exploited blocks, 1 as Critical and 4 under Safe category. The stage of ground water development of Over-Exploited blocks range from 116.10% (Sujangarh block, district Churu) to 256.21% (Sankra block, district Jaisalmer).

1.16.2 Dynamic Groundwater Resource (Saline Groundwater)

The assessed net availability of saline dynamic groundwater resource for the ACZ for year 2010 is shown in Table 1.16-2.

Table 1.16-2 Saline Dynamic Groundwater Resources (2010) of ACZ I (c)

		Vindhyan Sandstone	1.80
	Block Total		**10.29**
District Total			**201.38**
ACZ Ic Total			**869.79**

Note: Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 869.79 Mm^3. The net ground water availability in Bikaner district part of the ACZ is 564.67 Mm^3 while that of Churu district is 103.74 Mm^3. The net ground water availability in Jaisalmer district is 201.38 Mm^3. The maximum net

ground water availability is in Khajuwala block of Bikaner district amounting to 291.29 Mm^3.

1.17 Assessment of Groundwater Availability

The net dynamic fresh groundwater availability at year 2010 in ACZ I (c) is 456.54 Mm^3 and groundwater draft for all uses is 587.59 Mm^3. The stage of groundwater development in zone is 128.71% and is categorised as Over-Exploited zone. Saline groundwater resource of the zone is assessed at 869.79 Mm^3.

The total static groundwater resource in ACZ is assessed at 27,301.34 Mm^3, out of which 18,513.90 Mm^3 is saline groundwater.

1. Groundwater Study of Agroclimatic Zone II (a)

1.1 General

The ACZ covers an area of 37,054.95 km^2 and include districts of Nagaur, Sikar, Jhunjhunun and part of Churu district. The average annual rainfall in zone is 439.4 mm and mean annual evaporation 214.1 mm.

1.2 Geology

Most part of the ACZ is occupied with Quaternary alluvium which comprises river borne deposits such as sand, silt, clay and grave. The western and eastern parts of the ACZ are occupied with quartzite, phyllite/schist and marble rock formations of Pre-cambrian age.

1.3 Hydrogeology

Hydrogeology of hydro-strategraphic units as aquifers occurring in ACZ is described in following paragraph. Area occupied by various aquifer units in different blocks and districts of covering ACZ is given in Table 1.4-1. Hydrogeology map of ACZ II (a) is at Drawing No. ACZ II(a)-001.

Alluvium

This unit comprises unconsolidated to semi-consolidated sand, silt, clay and kankar, with occasional gravel beds. It occupies a large area in Churu, Nagaur, Sikar and Jhunjhunun districts. The thickness of the alluvium is limited to 200 m. The discharge of wells ranges from 0.93 to 2.47 lps. In Jhunjhunun district, the thickness of the alluvium ranges from 62 to 100 m. Groundwater occurs in pore spaces of sand and gravel under unconfined to semi-confined conditions. The yield of wells that tap the alluvium in Jhunjhunun district ranges from 0.81 to 4.17 lps.

In Pali district the value of transmissivity in alluvium ranges from 235 m^2/day in Ramanwas Kalen to 692 m^2/day in Kanawas.

In Jhunjhunun district, the yield of the tube-wells tapping alluvium ranges from 0.56 lps in Gunti village to 12.62 lps in Chaonara village. Transmissivity ranges from 122 m^2/day in Wahidpur to 7,766 m^2/day in Jodhpura. In the case of hardrocks, transmissivity ranges from 26 m^2/day in Gunti to 465 m^2/day in Moi Bharu. Groundwater occurs under unconfined to confined conditions, as is evident from the storativity values that from 1.06×10^{-2} to 5.48×10^{-5}.

In Sikar District, the yield of tube-wells tapping alluvium ranges from 0.88 lps in Ajpura to 5.45 lps in Thoi. Transmissivity ranges from 34 m^2/day in Bay to 3,914 m^2/day in Thethalia. The storativity of the alluvium ranges from 1.12×10^{-1} to 9.5×10^{-5}.

In Nagaur District, the yield of wells tapping alluvium ranges from 1.48 lps in Anandpura to 3.51 lps in Badauli. Transmissivity ranges from 156 m^2/day in Badauli to 323 m^2/day in Anandpura.

Tertiary Sandstone

This sandstone belongs to Palana Group of Tertiary age (Eocene). It is gritty, ferruginous, inter-bedded with shale, silt-stone and clay beds. It is also porous in nature and occurs around Merta Block of Nagaur district, and forms a good aquifer. Many exploratory wells have been constructed in Mata Shukh lignite mines area by RSML for dewatering of the water table. The thickness of the sandstone is more than 40 m and it is highly friable and loosely cemented. In areas near Mundwa and Jayal Tehsils, the thickness of sandstone varies between 100 and 250 m. The yield of dug wells that tap Tertiary sandstone ranges from 0.87 to 5.21 lps, while the yield of tube-wells tapping the sandstone range from 9.26 to 13.89 lps.

Vindhyan Sandstone

Vindhyan sandstone includes Nagaur sandstone and Jodhpur sandstone.

This sandstone is buff-red to dark coloured, fine to coarse-grained, inter-bedded with anhydrite and gypsum. Its occurrence is mainly around Nagaur and Mundwa Blocks of Nagaur District. It is also porous in nature and forms an aquifer of good potential. The thickness of this sandstone ranges from 140 to 240 m. The yield of tube-wells tapping Nagaur sandstone is moderate, ranging from 0.50 to 2.78 lps.

This sandstone is purple to brown-coloured, fine to course-grained micaceous and occurs around Ladnu Block of Nagaur district. It is porous and forms a good aquifer. Its thickness varies from place to place. Groundwater occurs under unconfined to semi-confined conditions. The thickness of this sandstone ranges from 100 to 250 m. The yield of tube-wells tapping this sandstone ranges from 0.93 to 2.47 lps.

Bilara Limestone

This is white to grey-coloured massive cherty and stromatolitic limestone. It covers a large area in the zone around Jayal, Mundwa, Nagaur and Merta Blocks of Nagaur district. The limestone is cavernous in nature and forms a good aquifer in this area. The thickness of the limestone ranges from 100 to 300 m. The yield of tube-wells tapping limestone ranges from 0.39 to 3.09 lps.

Gneisses

The Gneiss formation is generally found in the area around Parbatsar, Degana and Makrana Blocks of Nagaur district. They are dark to grey-coloured, medium to coarse-grained, compact and are generally covered by alluvium. These are porphyritic and non-porphyritic gneisses, associated with aplitic amphibolites, schist and augen gneisses. Groundwater is found in fractures and joints and the aquifer is considered to be of medium to low potential. The static water level (bgl) in the aquifer ranges from 15.26m to 15.68m. The yield of tube wells tapping Gneiss ranges from 1.65 lps to 3.50 lps.

Phyllite and Schist

Phyllite and Schist unit belong to Alwar and Ajabgarh Group of Delhi Super- Group. Amphibolites and mica-schist belonging to Alwar Group are arenaceous in nature. The biotite-schist is dark grey and foliated. Phyllites and schist are well foliated and green to dark grey and are well jointed and fractured. They occur in (a) south and

east of Jhunjhunun district (b) south-eastern part of Nagaur district (c) and in Danta Ramgarh, Piprali and Neem ka thana Blocks of Sikar district. The yield of wells tapping these formations is poor, ranging from 0.77 to 2.31 lps.

Quartzite

Quartzite is white to pale buff and pink in colour. In Jhunjhunun district area, the yield of -wells that tap quartzite aquifer ranges from 0.25 to 2.74 lps.

1.4 Main Aquifers units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 4 of Annex 2(b).

From the Table 1.5-1 it may be observed that explored aquifer depth of older alluvium aquifer unit of ACZ IIa ranges from 15.05m (Village Gwala, block Neem ka Thana, district Sikar) to 421.20m (Village Manasar, block Merta, district Nagaur); SWL (bgl) from 0.50m (Village Ramnarain ki Dhani, block Khandela, district Sikar) to 130m (Village Dabra, block Merta, district Nagaur) and well discharge from 0.04 lps (Village Janna, block Danta Ramgarh, district Sikar) to 312.88 lps (Village and block Kuchaman, district Nagaur).

The explored aquifer depth in Younger alluvium ranges from 30m (Village Tiba Basai, block Khetri, district Jhunjhunun) to 131m (Village Lotiya, block Khetri, district Jhunjhunun); SWL (bgl) from 7m (Village Tiba Basai, block Khetri, district Jhunjhunun) to 60m (Village Raipur, block Neem ka Thana, district Sikar) and well discharge from 2.80 lps (Village Tiba Basai, block Khetri, district Jhunjhunun) to 15.78 lps (Village Fatehpur, block Laxmangarh, district Sikar).

In Sedimentary aquifer the explored depth ranges from 31.39m (Village Pundlo, block Jayal, district Nagaur) to 442.86m (Village Lai, block Merta, district Nagaur); SWL (bgl) from 4m (village Lamba, block Merta, district Nagaur) to 110m (Village Harmawa, block Merta, district Nagaur) and well discharge from 0.17 lps (Village Jhareli, block and district Nagaur) to 39.55 lps (Village Kuchera, block Mundawa district Nagaur).

The explored depth in Hard-rock aquifer ranges from 12m (Village Biharipur, block Khandela, district Sikar) to 165.00m (Village Bahadurpur, block Khandela, district Sikar); SWL (bgl) from 1.92m (Village Jodhpura, block Udaipurwati, district Jhunjhunun) to 65m (Village Laxamangarh, block Danta Ramgarh, district Sikar) and well discharge from 0.13 lps (Village Badbar, block Udaipurwati, district Jhunjhunun) to 45.72 lps (Village Bagoli, block Udaipurwati, district Jhunjhunun).

1.6 Sub-surface Geology

Hydrogeological cross – section A-A' (Bosari – Bhawal)

The cross – section A-A' (Figure 1.6-1 and Figure 1.6-2) has been drawn from Bosari village in the north – west to Bhawal in south-east. Total length of the cross-section is 144 kms. The ground elevation ranges from RL 291 meters (Deh) to RL 327 meters (Bhawal) above mean sea level. The cross-section reveals that central part of the area is occupied by Older alluvium of Quaternary age comprising fine to coarse grained sand with maximum thickness of 315 meters. In north – western and south – eastern extremities the thickness of alluvium ranges from 35 meters to 160 meters below ground level. The alluvium is underlain by limestone and sandstone bed-rock of Marwar Super Group and Phyllite and Schist of Bhilwara Super Group. In south – eastern part near Dangawas village, outcrop of sandstone (Nagaur Sandstone of Marwar Super Group) is encountered at ground level.

The ground water levels in the area ranges from 31 meters below ground level (Deh) to 85 meters below ground level (Kheduli).

Figure 1.6-1 Hydrogeological Cross Section Lines of ACZ II(a)

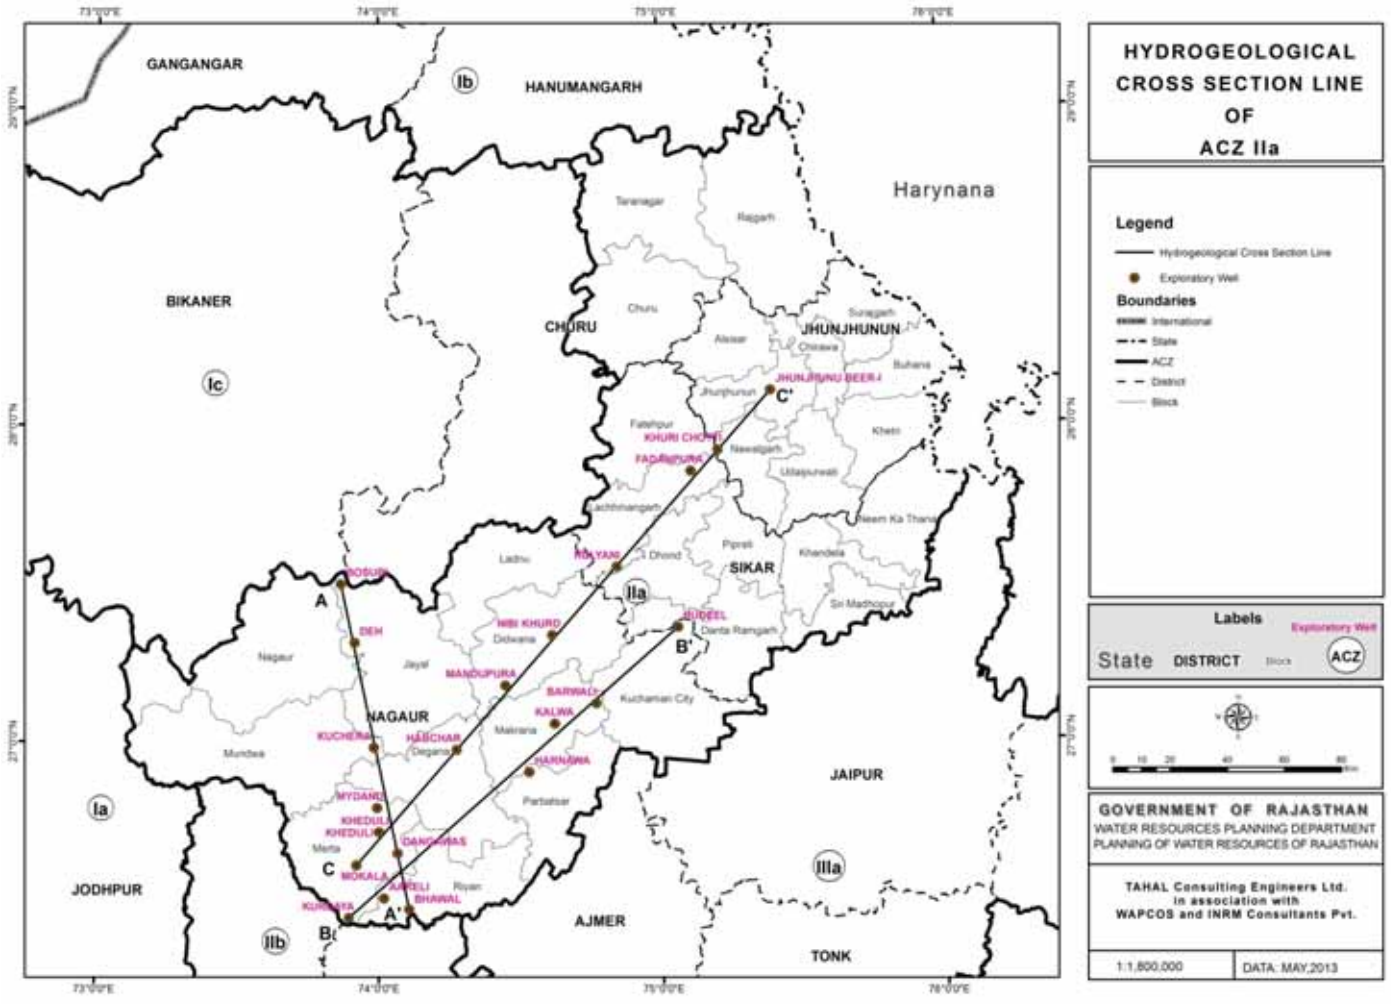

Figure 1.6-2 Hydrogeological Cross Section A-A' (Bosari – Bhawal)

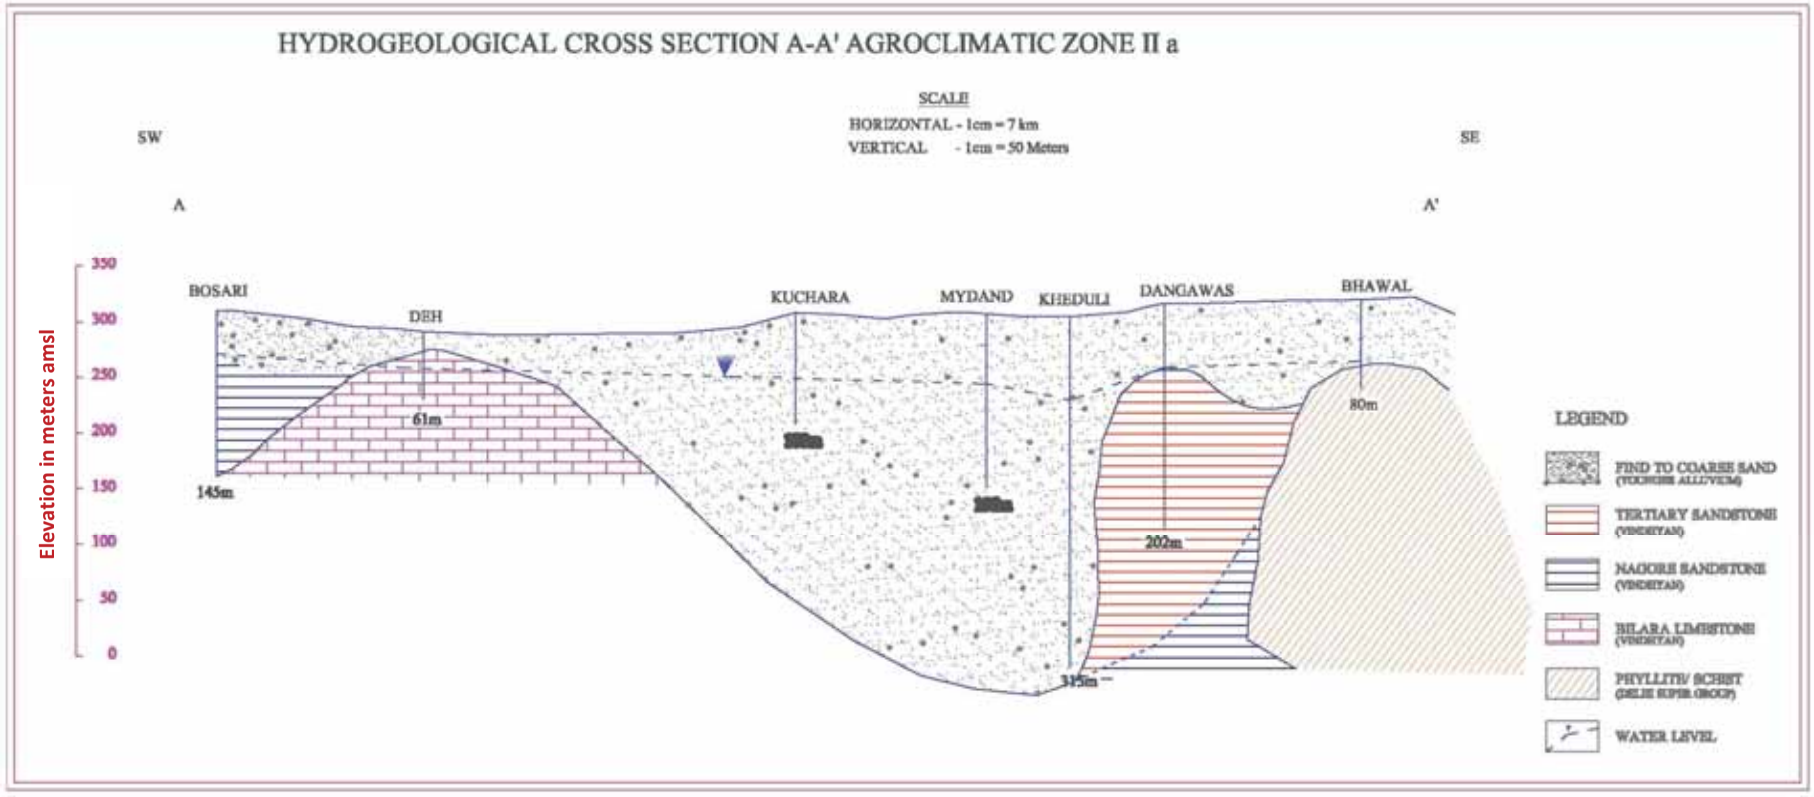

Source: - CGWB and RGWD

Hydrogeological cross – section B-B' (Kurdaya – Hudeel)

The cross – section B-B' (Figure 1.6-3) has been drawn from Hudeel village in north – eastern part of the Agroclimatic zone to Kurdaya village in the south – western part of the Agroclimatic zone. Total length of the cross – section is 191 kms. The ground elevation ranges from RL 317 meters (Aakeli) to RL 467 meters (Hudeel) above mean sea level. The cross – section reveals that thickness of alluvium of Quaternary age ranges from 60 meters (Kalwa) to 150 meters (Aakeli) below ground level. It comprises fine to coarse grained sand, clay and kankar. In south – western part, alluvium comprises well sorted sediments with coarse – grained sand and gravel with maximum thickness of 150 meters below ground level. It may be seen from the cross – section that in south-western part of the area alluvium is underlain by limestone bed-rock of Marwar Super Group, while in remaining part of the cross – sectional area alluvium is underlain by Phyllite and Schist bed-rock of Bhilwara Super Group.

The ground water levels in the area ranges from 48 meters below ground level (Kalwa) to 80 meters below ground level (Aakeli).

Hydrogeological cross – section C-C' (Mokala – Jhunjhunun)

The cross – section C-C' (Figure 1.6-4) has been drawn from Jhunjhunun village in extreme north – eastern part of the ACZ to Mokala village in south – western part of the Agroclimatic zone. Total length of the cross – section is 212 kms. The ground level elevation ranges from RL 305 meters (Kheduli) to RL 375 meters (Rulyani) above mean sea level. The cross – section reveals that older alluvium of Quaternary age comprising find to medium grained sand with clay and kankar is occupying whole cross -sectional area with depth varying from 48 meters (Mandupura) below ground level to 315 meters (Kheduli) below ground level. The thickness of alluvium is more in south-western part as compared to north- eastern and central parts of area. The cross – section depicts that alluvium is underlain by Quartzite, Phyllite and Schist bed-rocks of Delhi Super Group as well as Gneisses (B.G.C.) rock formation.

The saturated thickness of alluvium in the area ranges from 10 meters (Habobar, Mandupura) to 250 meters (Khedule) below ground level. Water level varies from 35 meters below ground level. (Khuri Choti) to 60 meters below ground level (Jhunjhunun, Kheduli).

1.7 Depth to Groundwater

The pre-monsoon (2010) ground water level map of ACZ II (a) is at Drawing No. ACZ II(a)-003. It may be seen there from that over large part of ACZ the ground water depths generally range from 20 to 80m (bgl).

In western part of ACZ, in Mundwa and Merta blocks of Nagaur district, the levels are deep and range from 60 to 120m (bgl). When compared with post-monsoon (2010) map of ACZ, (Drawing No. ACZ II(a)-004) no change in levels are noticeable over what existed in pre-monsoon of 2010.

1.8 Ground water Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ II (a) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Aquifer-wise/ block-wise fluctuation in levels of ground water-ACZ II (a)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)

ACZ Summary			**450**	**-5.82**	**10.05**	**0.45**

Source: - CGWB and RGWD

The average ground water level fluctuation in the ACZ for older alluvium ranges from -0.65m in Khandela block of Sikar district to 2.74 m in Ladanu block of Nagaur district. In Younger alluvium the average ground water level fluctuation ranges from -0.10m in Chirawa block of Jhunjhunun district to 2.65 m in Udaipurwati block of Jhunjhunun district.

In Sedimentary aquifers the average fluctuation in the ACZ ranges from – 0.94 m (Tertiary Sandstone) in Mundwa block of Nagaur district to 0.65 m (Bilara Limestone) in Jayal block of Nagaur district. In hard rock aquifers the average ground water level fluctuation ranges from 0.38 m (Quartzite) in Piprali block of Sikar district to 4.40 m (Quartzite) in Khetri block of Jhunjhunun district.

1.9 Ground water Levels and Flow Directions

This ACZ constitutes parts of four basins, namely the Outside Basin (the major part), the Luni, the Shekhawati and the Sabi river basins, each one with its own groundwater flow configuration (Drawing No. ACZ II(a)-002). Such as is the case in all Rajasthan except the Outside Basin, the configuration of groundwater level contours is dominated by surface water flow pattern. Within the Outside Basin part of the ACZ, unlike the other ones, there is virtually no surface water drainage channel which may clearly indicate the groundwater flow trend as well, and the water level contours point to northward and westward flow components to other, downstream portions of the basin. In the Luni part of the ACZ the groundwater flow is due west, towards the northern channel of the Luni river, and in the Shekhawati part of the ACZ it is possible to follow all four components of the groundwater drainage regime; to the north, following the Kantli River, surface and groundwater disappear into the alluvial and windblown sands of the Outside Basin, in the north east, following the Krishnawati and the Dohan rivulets groundwater is drained into the state of Haryana, and in the south the flows towards the Sambhar Lake, from the north east (Mendha Basin) and the south west, can be seen. In the east the groundwater flows along the upstream portion of a Sabi River tributary (Map ACZ IIa-002).

The configuration of water level contours within the alluvial, sandstone and limestone point to very moderate gradient, 2 – 3m per 1km to almost flat, 0.5km per km in the west. It may clearly indicate that the relevant aquifers are of remarkable transmissivity/thick operative profile that can support deep drilling and highly discharging tube-wells. It may also suggest that the groundwater recharge there is not impressive and, accordingly, the poor extent of groundwater flow.

The aquifers in this ACZ are quite many – the Older Alluvium in all river basins, the Younger Alluvium in the Outside Basin, Shekhawati and Sabi river basins, Tertiary and Vindhyan Sandstones, Phyllite& Schist, and Bilara Limestone in the Outside Basin and the Luni River Basin, Quartzite in all four basins, Gneisses in Luni and Shekhawati river basins and the Gneisses (B.G.C.) in the Outside Basin part. The main aquifers in this ACZ are the alluvial, sandstone and limestone whereas the Quartzite, Gneisses and granite are of poor to very poor hydraulic properties (Map ACZ IIa-001). This point is clearly demonstrated by the steep flow gradient in the east, within the Sabi and Shekhawati river basins constituents of the ACZ.

Depth to groundwater level throughout the ACZ, along with the lithology, not including the alluvial formations, may address the issue of aquifer hydraulic properties (after discarding the ground elevation). This is the empirical rule in Rajasthan east of the Aravallies where the water bearing beds are usually perched on top of impervious to semi impervious rocks and the operative profile is rather limited. In the Outside Basin part of this ACZ the maximal reported depth to water level reach 70 – 80m bgl, in the sandstone and limestone formations of the Nagaur district that are known to have thickness of hundreds of meters. The rest of the area is characterized by water levels of 20 – 40m bgl (Map ACZ IIa-003).

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ II(a) are shown in Figure 1.10-1 to 1.10-30. The supportive data for the same is given in Annex 9.

1.10.1 Churu District

In the year 1984 the pre-monsoon average groundwater levels in Churu district vary between a minimum of 214.01 m amsl (Rajgarh block) and maximum of 258.04 m amsl (Churu block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 212.58 m amsl (Rajgarh block) and a maximum of 256.71 m amsl (Churu block). Long term ground water levels in each block are presented in Figure 1.10-1 to 1.10-8 The level change rates are given in Table 1.10-1.

In Churu and Rajgarh Blocks, the pre-monsoon rate of decline is 0.04 and 0.05 m/yr (respectively) and in post-monsoon 0.6 m/yr (for both of them). In Taranagar Block, however, the long-term trend is rather mor steep with 0.14 and 0.13 m/y for pre and post-monsoon seasons respectively.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Churu Block where average groundwater levels are predicted to reach 254.63 m amsl by the year 2060, ~2 below current stages. As a result, 52% of the monitoring wells (CGWB & RGWD) in the block will probably dry.

1.10.2 Jhunjhunun District

In the year 1984 the average pre-monsoon groundwater levels in Jhunjhunun district vary between a minimum of 258.72 m amsl (Sujangarh block) and maximum of 388.41 m amsl (Udaipurwati block) while in the year 2010 the pre-monsoon average ground water level in this district ranges between a minimum of 237.09 m amsl (Sujangarh block) and a maximum of 375.65 m amsl (Udaipurwati block). Long-term ground water levels in each block are presented in Figure 1.10-1 to 1.10-8 The level change rates are given in Table 1.10-1.

In Alsisar Block the pre-monsoon rate of decline is -0.10 m/yr and in post-monsoon -0.11 m/yr. In Chirawa Block, however, the long-term trend is rather more steep with -0.81 m/y for pre-monsoon season -0.84 for post-monsoon season.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Buhana, Chirawa and Surajgarh Blocks where average groundwater levels are predicted to reach 219.91, 220.48 and 197.46 m amsl respectively by the year 2060, ~40 below current stages. As a result, 100% of the monitoring wells (CGWB & RGWD) in blocks will probably dry.

1.10.3 Sikar District

The pre-monsoon average groundwater levels in Sikar district in the year 1984 vary between a minimum of 295.37 m amsl (Fatehgarh block) and maximum of 469.53 m amsl (Srimadhopur block) while in the year 2010 pre-monsoon the average ground water level in this district ranges between a minimum of 288.32 m amsl (Fatehpur block) and a maximum of 448.02 m amsl (Srimadhopur block). Long term ground water levels in each block are presented in Figure 1.10-1 to 1.10-8 The level change rates are given in Table 1.10-1.

In Sikar district all blocks have registered decline in levels of ground water. In Srimadhopur block, steep decline is registered at a rate of -0.77 m/yr. In both periods of the years, the decline in Fatehpur block is 0.24 m/yr. Also a steep decline rate of 1.09 m /yr. is registered in pre and post-monsoon period in Dhond block. In Ramgarh block, the rate of decline is two seasons over a period of time is -0.78 m/yr.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions(using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Dhond and Piprali block where average groundwater levels are predicted to reach 331.17 m in Dhond block and 390.34 m in Piprali block (amsl) by the year 2060, ~31 and ~8 m below current stages. As a result, 100% of the monitoring wells (CGWB & RGWD) in these blocks will probably dry.

1.10.4 Nagaur District

In the year 1984 the pre-monsoon average ground water level in Nagaur district vary between a minimum of 253.43 m amsl (Nagaur block) and a maximum of 406.26 m amsl (Parbatsar block) while in the year 2010 the pre-monsoon average ground water level in this district ranges from a minimum of 250.25 m amsl (Jayal block) to a maximum of 383.04 m amsl (Parbatsar block). Long-term groundwater levels in each block are presented in Figure 1.10-9 to 1.10-19. The level change rates are given in Table 1.10-1.

All blocks of the district represent a decline in levels of groundwater (Nagaur Block has very small declining rate). In Riyan block, the pre-monsoon rate of decline is 0.40 m/yr and in post-monsoon 0.37 m/yr. A steep decline rate of 0.77 m/yr is recorded in Parbatsar block of the district and peeks and trough can be seen to correspond with seasonality of rainfall pattern. In Nagaur block, however, the long term trend is rather stable of the order of 0.1 and 0.2 m/yr respectively for pre and post-monsoon periods. The well hydrograph is a classic example of correspondence between rainfall and water level rise which can be viewed for scene of alternating peaks and troughs in the data plot.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years, it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table

1.10-2). Accordingly, the most severe scenario is expected in Riyan Block where average groundwater levels are predicted to reach 311.49 m amsl by the year 2060, 16 m below current stages. As a result, 100% of the monitoring wells (CGWB & RGWD) in the block are likely to go dry.

In Mundwa block of Nagaur district the rate of decline is also steep and it is 0.66 m/yr for pre-monsoon periods and 0.68 m/yr for post-monsoon periods.

Table 1.10-1 Long-term Groundwater Levels Change Rates– ACZ II (a) 1984-2010

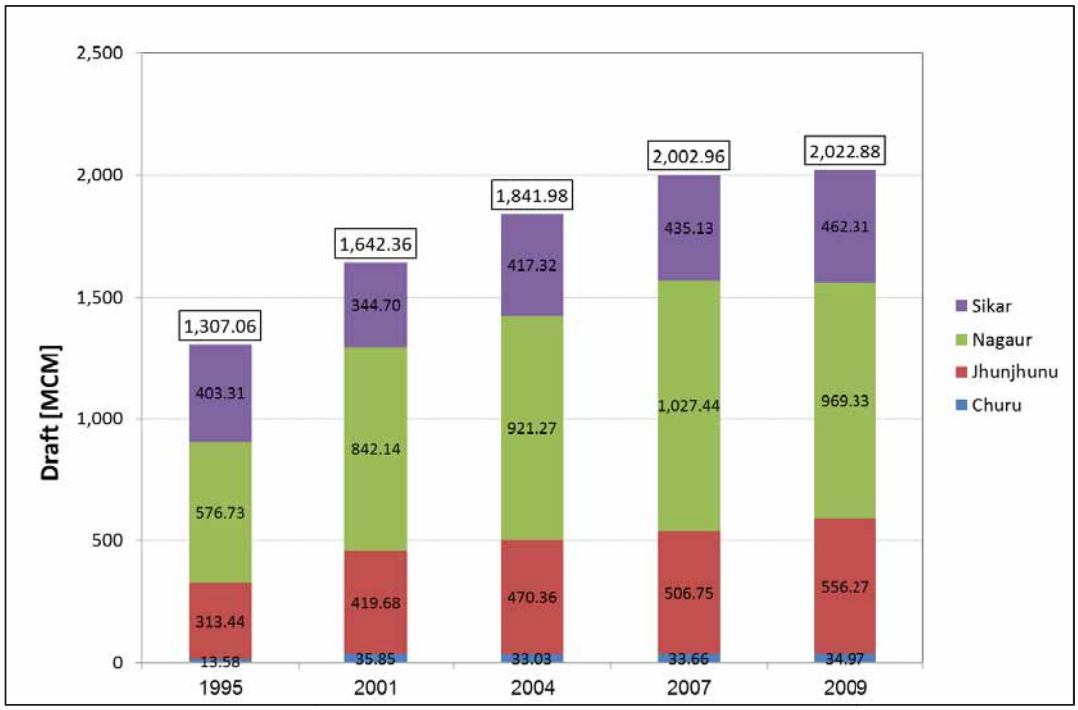
1.11 Long-term drafts

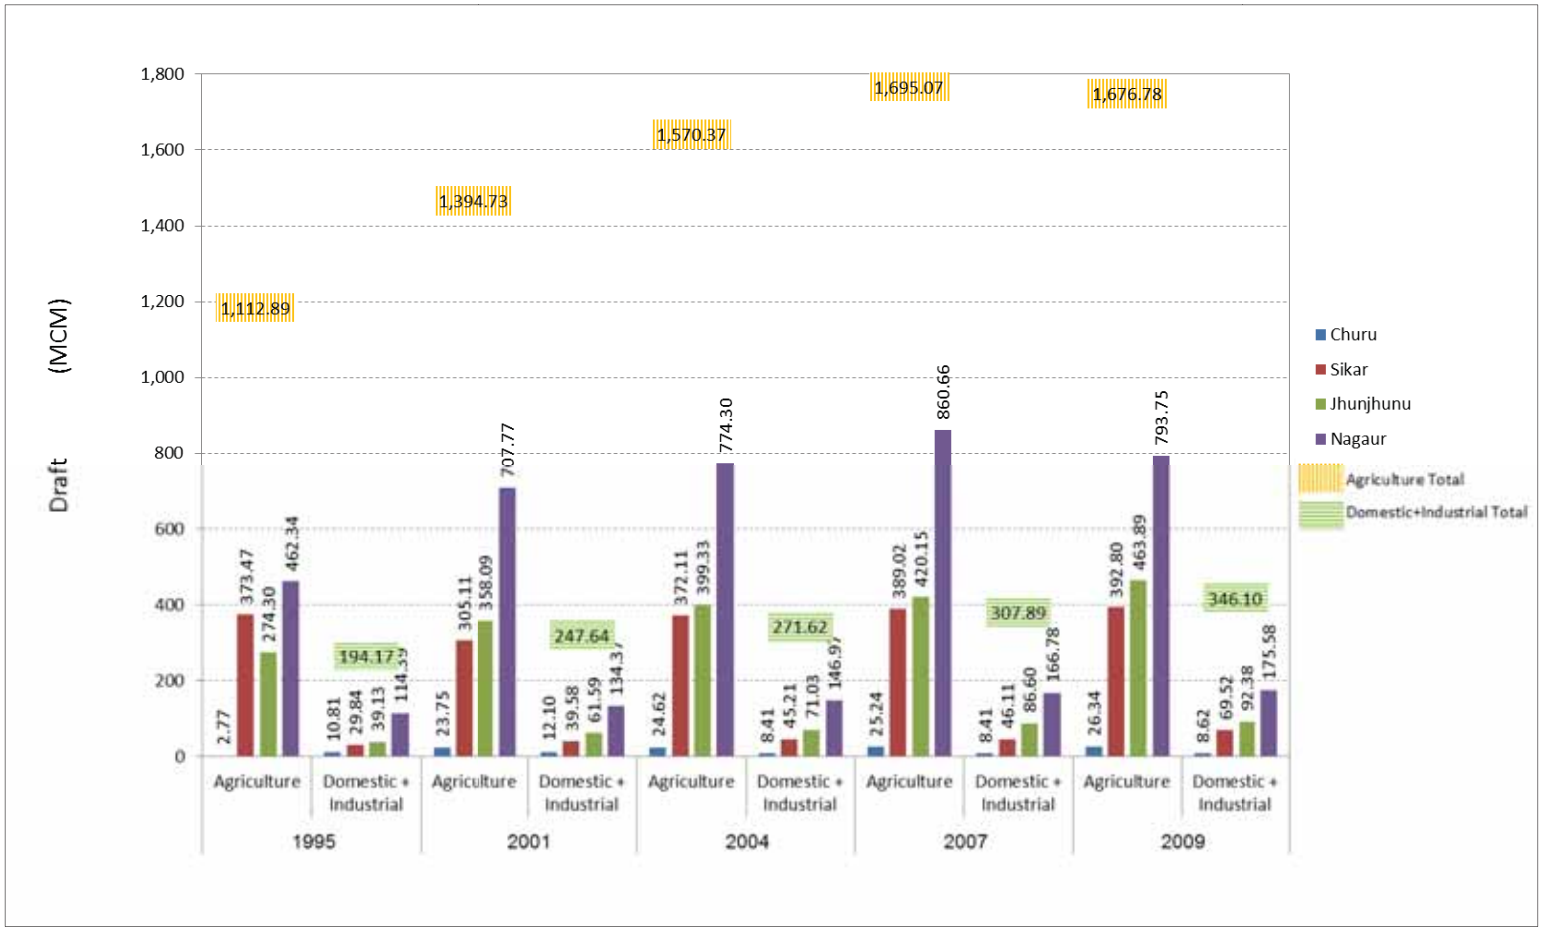
Groundwater draft in ACZ IIa ranges between 1,307 Mm^3 during 1995 and 2,023 Mm^3 during 2009. The volume rises from 1995 to 2007 and stabilizes between 2007 and 2009. Generally most of the groundwater is being used for irrigation with an average range of 68% - 89% out of the total draft in ACZ IIa. Most productive district is Nagaur that yield 49% draft out of the total draft in the ACZ (Figure 1.11-1, Table 1.11-5).

Figure 1.11-1 Total Groundwater Draft for all uses in ACZ IIa by Districts (1995-2009)



Source: CGWB and RGWD

Figure 1.11-2 Groundwater Draft for Agriculture and Other Uses in ACZ IIa by Districts



Source: CGWB and RGWD

1.11.1 Churu District

Groundwater draft in Churu district comprises ~2% out of the total average draft within ACZ IIa (three blocks out of six belong to ACZ II a, the rest are within ACZ Ic) this ratio remains also during 2009. Throughout the examined time period the draft ranged between 14 Mm^3 (0.002 Mm^3/km^2) during1995 and 35 Mm^3 (0.006 Mm^3/km^2) during 2009, nevertheless the main rise occurred between 1995 and 2001 – a total rise of 158% within 7 years (Figure 1.11-1, Table 1.11-1, Table 1.11-5). The most productive block is Rajgarh with 77% out of the total volume during 2009.Taranagar Block has no draft at all because of large presence of saline groundwater. Most of the groundwater in Rajgarh Block (79%) is used for agriculture, whereas it is only 37% in Churu Block and the rest 63% is used for domestic & industrial uses (Figure 1.11-3, and Table 1.11-1).

Table 1.11-1 Total Change in Groundwater Draft - Churu District (within ACZ IIa) 1995 - 2009

Block	Change in Agriculture Use	Change in Domestic and Industrial Uses	Total Change
Churu	+114%	-35%	-4%
Rajgarh	>+500%	+2%	+402%
Taranagar	0	0	0
District Total	**>+500%**	**-20%**	**+158%**

1.11.2 Sikar District

Groundwater draft in Sikar district comprises 23% out of the total average draft within ACZ IIa, this ratio remains also during 2009. Throughout the examined time period the draft ranged between 403 Mm^3 (0.051 Mm^3/km^2) during1995 and 462 Mm^3 (0.059 Mm^3/km^2) during 2009 – a total rise of 15% within 15 years (Figure 1.11-1, Table 1.11-2, Table 1.11-5). During 2009 the most productive block was Danta Ramgarh with 18% out of the total volume. Most of the groundwater was used for irrigation, with a range of 76%-94% out of the total use within a block; the rest was used for domestic and industrial purposes (Figure 1.11-4, and Table 1.11-2).

Table 1.11-2 Total Change in Groundwater Draft – Sikar District (within ACZ IIa) 1995 – 2009

Block	Change in Agriculture use	Change in Domestic and Industrial Uses	Total Change
Danta Ramgarh	+9%	+100%	+15%
Dhond	+8%	+103%	+16%
Fatehpur	+60%	+279%	+94%
Khandela	+5%	+113%	+11%
Lachhmangarh	+69%	+202%	+83%
NeemKa Thana	+3%	+142%	+15%

1.11.3 Jhunjhunun District

Groundwater draft in Jhunjhunun district comprises 26% out of the total average draft within ACZ IIa, and 27% during 2009. Throughout the examined time period the draft ranged between 313 Mm^3 (0.053 Mm^3/km^2) during 1995 and 556 Mm^3 (0.094 Mm^3/km^2) during 2009 – a total rise of 77% within 15 years (Figure 1.11-1, Table 1.11-3, Table 1.11-5). The most productive block is Udaipurwati with an average of 18%, nevertheless during 2009 draft in Udaipurwati and Nawalgarh blocks was 17% (in each) out of the total average volume within the district. Most of the groundwater was used for irrigation, with a range of 69%-88% out of the total use within a block; the rest was used for domestic & industrial purposes (Figure 1.11-5, and Table 1.11-3).

Table 1.11-3 Total Change in Groundwater Draft – Jhunjhunun District (within ACZ IIa) 1995 – 2009

Block	Change in Agriculture use	Change in Domestic and Industrial Uses	Total Change
Alsisar	+793%	+151%	+415%
Buhana	+61%	+123%	+70%
Chirawa	+54%	+142%	+64%
Jhunjhunun	+184%	+121%	+167%
Khetri	+25%	+142%	+35%
Nawalgarh	+75%	+168%	+83%
Surajgarh	+50%	+88%	+54%
Udaipurwati	+47%	+177%	+59%
District Total	**+69%**	**+136%**	**+77%**

1.11.4 Nagaur District

Groundwater draft in Nagaur district comprises 49% out of the total average draft within ACZ IIa, and 48% during 2009. Throughout the examined time period the draft ranged between 577 Mm^3 (0.033 Mm^3/km^2) during 1995 and 969 Mm^3 (0.055 Mm^3/km^2) during 2009 – a total rise of 68% within 15 years (Figure 1.11-1, Table 1.11-4, Table 1.11-5). The most productive block is Mundwa with an average of 20% out of the total average volume within the district. Most of the groundwater was used for irrigation, with a range of 57%-91% out of the total use within each block; the rest was used for domestic & industrial purposes (Figure 1.11-6, and Table 1.11-4).

Table 1.11-4 Total Change in Groundwater Draft – Nagaur District (within ACZ IIa) 1995 – 2009

Block	Change in Agriculture use	Change in Domestic and Industrial Uses	Total Change
Degana	+16%	+59%	+24%
Didwana	+150%	+182%	+155%

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 3828 villages in ACZ II(a), 1220 are found suitable for drinking water use, 1736 for irrigation use and 2954 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in ground water is summarised in Table 1.12-1.

Table 1.12-1 Village and block wise water quality

ACZ	District	Block	Total Number of Villages	Electrical Conductivity, µS/cm			Chloride, mg/l			Fluoride, mg/l			Nitrate, mg/l		
				Highest Desirable Limit: 750	Maximum Permissible Limit: 2,250	Above Maximum Permissible Limit: 2,250	Highest Desirable Limit: 250	Maximum Permissible Limit: 1000	Above Maximum Permissible Limit: 1000	Highest Desirable Limit: 1.0	Maximum Permissible Limit: 1.5	Above Maximum Permissible Limit: 1.5	Highest Desirable Limit: 45	Maximum Permissible Limit: 100	Above Maximum Permissible Limit: 100

Source: - CGWB and RGWD

It may be seen from above that out of 3828 villages of ACZ IIa, 1378 fall under desirable, 1541 under maximum permissible limit and 909 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 1081 while number of villages with maximum permissible limit of use is 582 and number of above maximum permissible limit for Fluoride is 2165. As regards presence of nitrate in ground water, 1133 fall under highest desirable limit of less than 45 mg/l and 1401 under maximum permissible limit along with 1294 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 1456 villages fall under maximum permissible limit and 2092 under above maximum permissible limit of 2250 microhos/cm and 280 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

Ground Water Quality of ACZ II (a) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ II(a) is shown in Drawing No. ACZ II(a)-005. Various levels of chloride concentrations, more or less, occur in equal proportions in the ACZ. Area of fresh ground water with Chloride level of less than 250 mg/l occur in older alluvial aquifer in eastern and southern parts of ACZ covered by Jhunjhunun, Sikar and Nagaur districts. The ground water with 250-1000 mg/l of chloride level occurs in northern, central and western part of the ACZ occupied by Older alluvium, Tertiary sandstone, Bilara limestone, Gneiss and Phyllite and Schist units.

Block-wise / aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in the Table 1.12-2.

Table 1.12-2 Percent area occupied with various level of Chloride in ground water of ACZ II (a)

ACZ IIa Summary			**30.86**	**41.34**	**27.80**

Source: - CGWB and RGWD

From the table it may be seen that only 10% area of Churu district, and 11% of Nagaur district bear potable ground water with <250mg/l chloride. However, a large part as much as 67% in Jhunjhunun district and 65% in Sikar district comprises potable quality ground water within permissible limit of 250 mg/l of chloride. In the entire ACZ, about only 31 % area bear potable quality ground water with respect to concentration of chloride in different aquifers of ACZ. It is depicted from the table that 100% area in Tertiary sandstone aquifer unit in Jayal block, Phyllite/Schist aquifer unit in Kuchaman block and Bilara limestone aquifer unit of Riyan block of Nagaur district bear undrinkable quality of ground water with chloride levels exceeding 1000 mg/l.

i) Ground Water Quality of ACZ II (a) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ II(a) is shown in Drawing No. ACZ II(a)-006. From the map, it can be seen that nearly most of the area of ACZ in Sikar and Jhunjhunun districts bear safe ground water of drinking water quality with concentration of nitrate between less than 45 and 100 mg/l. High nitrate level ground water with concentration >100mg/l occur in Taranagar, Churu, Rajgarh block of Churu districts and Ladanu, Didwana, Makrana, Kuchaman city, Jayal, Degana and Nagaur blocks of Nagaur district, where aquifer units are alluvium, limestone and sandstone.

Block-wise / aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

ACZ IIa Summary			**27.43**	**37.21**	**35.36**

Source: - CGWB and RGWD

From the table, it can be seen that in Jhunjhunun, Churu and Sikar district of ACZ, the potable quality ground water range from 20% in Churu to 50% in Jhunjhunun district, the remaining being water of poor quality. In Nagaur district only 16% area comprises potable ground water with respect to occurrence of nitrate in ground water. A large part of older alluvium aquifer in Churu block of Churu district; Tertiary sandstone aquifer in Degana block, Older alluvium aquifer unit of Jayal block of Nagaur district have nitrate concentration in ground water reaching beyond 100 mg/l

ii) Ground Water Quality of ACZ II (a) by fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ II(a) is shown in Drawing No. ACZ II(a)-007. From the map, it may be seen that potable quality of ground water with fluoride concentration of <1.5mg/l occur in Older and Younger Alluvial aquifer units in northern and eastern parts of the Churu, Jhunjhunun and Sikar districts. The western part of the ACZ occupied with various aquifer units viz. Tertiary sandstone, Bilara limestone, Alluvial and Gneiss rock units mostly of Nagaur and Sikar districts is non-potable quality ground water.

Block-wise/aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

ACZ IIa Summary			**25.03**	**13.62**	**61.35**

Source: - CGWB and RGWD

It may be observed from the table as above, that about 61% area of the ACZ bear non-potable ground water with fluoride content being >1.50 mg/l. About 96% area of Nagaur district bear poor quality fluoride rich ground water. In this ACZ, 100% fluoride rich ground water (>1.5 mg/l fluoride content) occur in Older alluvium , Tertiary and Vindhyan sandstone, Phyllite/Schist and Gneiss unit of Riyan, Parbatsar, Kuchaman city, Merta, Makarana, Degana and Didwana blocks of Nagaur district; Younger alluvium aquifer unit in Surajgarh block of Jhunjhunun district and Younger alluvium aquifer unit in Fatehpur block of Sikar district.

iii) Ground Water Quality of ACZ II (a) by EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ II(a) is shown in Drawing No. ACZ II(a)-008. It can be observed from map that northern and southern part of the ACZ in Churu and Nagaur district bear high salinity groundwater where EC concentration range between 2250-5000 micromhos/cm. The north-western and eastern part occupied with alluvium and quartzite units in Jhunjhunun and Sikar districts have low salinity level ground water of <750 and 750-2250 micromhos/cm concentrations.

Block-wise / aquifer-wise percent area occupied with various levels of EC in groundwater of ACZ is shown in Table 1.12-5.

Table 1.12-5 Percent area occupied with various level of EC in ground water of ACZ II (a)

Source: - CGWB and RGWD

From table it can be seen that 100% areas of Vindhyan sandstone unit in Didwana block, Quartzite aquifer unit in Makrana block; and over 97% area in Older alluvium aquifer unit in Nagaur block of Nagaur district and 100% area in Quartzite aquifer unit of Fatehpur block of Sikar district bear EC level that range of 2250-5000 micromhos/cm.

1.12.3 Long term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ II(a) are shown in Figure 1.12-1 to 1.12-60. The supportive data for the same is given in Annex 10.

Groundwater quality in ACZ IIa has a large spatial heterogeneity. Generally, the districts of Nagaur and Churu present lower groundwater quality than Sikar and Jhunjhunun. The northern part of the ACZ is characterized with one of the major irrigation canal projects in Rajasthan. The canals have a substantial effect on groundwater level sand flow regime. There seems to be a direct correlation between depth to groundwater and groundwater quality: deeper groundwater levels generally have better recorded qualities (e.g. Mundwa Block has extremely deep groundwater and its quality is relatively good as compared to its surroundings).

Sikar District

Average Chloride (Cl) and EC concentrations per block for the period 1984-2009 are presented in Figures 1.12-1 to 1.12-15 (odd figures). The graphs demonstrate that there is a positive correlation between the two parameters even though it is not significant in all blocks. The long term trends of average Cl in most blocks during most of the period fluctuate between 100 and 600 mg/l, but are usually below the desirable limit for drinking water (500 mg/l). The long term concentration trends of Cl in most of the blocks remain almost unchanged throughout the years. The depth to groundwater is

relatively high, which is probably the main cause for the low concentrations. Danta Ramgarh Block has the highest levels of groundwater salinity with a maximum value of~700 mg/l, presenting seasonal and annual fluctuations that are larger compared to other blocks in the district. This block is on the border between two zones, where the north and eastern directions have much better groundwater quality than in the south and east.

Average EC values are usually between 1,000 and 4,000 µS/cm. During most of the time in most of the blocks the concentrations are within the permissible limits for drinking water. EC trends follow Cl trends in most of the blocks and remain almost unchanged throughout the examined period. Maximum concentrations were recorded in Fatehpur Block with values that reach almost 4,000 µS/cm. The EC concentrations are relatively good and suitable for agricultural purposes. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ II(a)-009.

Average Nitrate and Fluoride levels per block for the period 1984-2009 are presented in Figures 1.12-2 - 1.12-16 (even figures). Average NO_3 concentrations range during most of the aforementioned time period in most of the area between 20 and 500 mg/l. Most of the blocks have NO_3 concentration above the permissible limit for drinking water (100 mg/l). Highest nitrate levels were found in Fatehpur block with peaks reaching more than 500 mg/l while lowest concentrations were recorded in Srimadhopur block with less than 20 mg/l. There is a relatively large heterogeneity of NO_3 concentrations, some of the blocks show decreasing values whereas other show increasing values. The Fluoride concentrations have large heterogeneity in space and time. In general, the concentrations range between 0.5 and 3 mg/l.

Nagaur District

Water quality in Nagaur district is not suitable for drinking in most of the blocks during most of the time with significantly higher concentrations than the permissible limits for EC, NO_3 and F (2,250, 100 and 1.5 respectively). In addition the suitability for agricultural purposes is also limited, as explaind below.Surprisingly, average Cl levels are below maximum permissble standard for domestic usage, in most of the blocks. The district is characterised by relatively large draft volumes resulting severe declining trends of groundwater levels.

Average Cl and EC concentrations per block are presented in Figures 1.12-17 to 1.12-37 for the period 1984-2009.The long term trends of average Cl concentration in most blocks during most of the examined time period fluctuate within the range of 300 and 1,000 mg/l, and are usualy lower than the permissible limit for drinking water (1,000 mg/l). However, average concentrations vary between a minimum of ~100 mg/l in Landu and Mundwa Blocks and a maximum of ~1,300 mg/l in Degana, Jayal and Merta Blocks.Correllation between the two parameters can be found in some of the blocks, however, in others the trends behave differently, reflecting perhapse the presence of other dominantions in the groundwater. This might also explain the fact that Cl levels are usually within permissble limits while EC levels, in most blocks are exceeding the maximum accepted concentrations. There is a large variation in the long term Cl values between the blocks.In some cases the concentrations are dropping with rates of -4 to -7.5 mg/l/yr(Parbastar and Didwana blocks respectively),while in most blocks they are rising with rates of +6 to+20 mg/l/yr. These rises might be linked to the sharp groundwater levels decline that are recorded in the district. Makrana Block has relatively unchanged long term Cl trends.

Average EC levels in the district are usually between 2,000 and 5,000 µS/cm in most blocks;mostly more than the permissible limit for drinking and irrigation water (2,250 µS/cm).Minimum concentrations are recorded in Parbatsar Block with ~1,000-3,000 µS/cm, whereas maximum values are recorded in Nagaur Block with ~5,000-7,000 µS/cm. Relative growth is evident in most areas, yet the spatial distribution seems to be approximately unchanged.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figures 1.12-18 to 1.12-38 (even figures). Average NO_3 concentrations in most blocks are between 100 and 250 mg/l, significantly higher than the permissible concentration for drinking water (100 mg/l) during most of the time and in most of the district area. Nevertheless, the intensity of the principal nitrates plumes seems to be decreasing along the years. Peak values were recorded as high as 500 mg/l (five times higher than permisiible limit for drinking water) in Didwana Block.

Fluoride concentrations have high heterogeinity in space and time. Generally the average values range between 1 and 3 mg/l, mostly above the permissible limit for drinking water (1.5 mg/l). Kuchaman City block presents the lowest concentrations with 1 – 2 mg/l most of the time, whereas Makrana block presents the highest concentrations with very large variations and a peak value of ~6.5 mg/l.

Jhunjhunun District

Average Chloride and EC concentrations for the period 1984-2010 are presented in Figures 1.12-39 to 1.12-53 (odd figures) per block. The long term trends of average chlorides in most blocks during most of the time period fluctuate between ~100 and ~800 mg/l, lower than the permissible limit for drinking water (1,000 mg/l) and even ocasionally lower than the desirable limit for drinking water (250 mg/l). Highest concentrations are presented in Alsisar Block with values between ~500 and ~800 mg/l with ralatively high fluctuations in time.It seems that Alsisar Block is affected by plume of higher concentration of Cl which is found in Churu district to the northwest. Lowest concentrations are recorded in Udaipurwati Block with 100 -200 mg/l.Long term Cl trends seems to be approximately stable.

EC levels in the district are relatively better (lower)compared to other areas in the ACZ, and generrally suitable for agriculture. Long term EC concentrations present a positive correlation with the long term Cl concentrations.The long term trends of average EC in most blocks during most of the time period fluctuate between ~1,000 and ~3,000 µS/cm, usually within the permited range for drinking (<2,250 µS/cm).Minimum values were recorded in Udaipurwati and Khetri Blocks with ~1,000 µS/cm, whereas maximum values were recorded in Alsisar Block with 3,000-5,000 µS/cm. Generally the long term trend of EC values is stable with low fluctuations.

Average NO_3 and F values for the period 1984-2010 are presented per block in Figures 1.12-40 to 1.12-54 (even figures). Average concentrations of nitrates in most blocks during most of the examined time period range between 50 and 150 mg/l. In most of the blocks the nitrate concentration fluctuates around the permmisible limit for drinking

water, partially above it and partially below it.Peak values were recorded in Alsisar Block with more than 400 mg/l.

Fluoride concentrations present high variation in space and time. Generally the concentrations fluctuate between 1 and 3 mg/l. The values fluctuates in time above and below the permissible limit for drinking water (1.5 mg/l). Chirawa, Buhana and Alsisar Blocks present the highests concentrations with high fluctuations. Lowest concentrations are found in Khetri Block within permissible limits (lower than 1.5 mg/l) almost during the entire time period.In most blocks, F levels are close to stable in the long term.However, Buhana Block presents rising concentrations and Jhunjhunun presents decreasing concentrations.

Churu District

Average Chloride and EC concentrations for the period 1984-2009 are presented per block in Figures 1.12-55 to 1.12-59 (odd figures).Generally, the Cl concentration in the district is high and not suitable for irrigation or for domestic use. The long term trends of average Cl in most blocks during most of the period fluctuate within the range of 800 to 1,400 mg/l, mostly above the permissible concentration for drinking water (1,000 mg/l). Churu and Rajgarh blocks show fluctuating values mainly between 800 and 1,300 mg/l, whereas Taranagar Block shows a relatively sharp decrease with large fluctuations from ~1,400 mg/l during 1984 to ~300 mg/l during 2009. Along the examine time period there is an improvement of Cl concentrations in Tranagar Block. This is attributed to a major irrigation project with relatively large quantities of leakage of water from canals.

EC values are usually between 4,000 and 7,000 µS/cm, significantly above the permissible limit for drinking water (2,250 µS/cm).Generally, EC values correlate to Cl concentration, both presenting similar trends. Churu and Rajgarh Blocks have the highest levels with more or lesss table long term values within the range of 8,000 to 12,000 µS/cm. Taranagar Block shows a sharp decrease of EC values from >10,000 µs/cm during 1985 to ~4,000 µS/cm during 2009. Generally the EC values are high and are not suitable for all agricultural uses.

Average NO_3 and F values for the period 1984-2009 are presented per block in Figures 1.12-56 to 1.12-60 (even figures). Average NO_3 concentrations in most blocks during most of the examined time period are between 200 mg/l and 500 mg/l, significantly higher than the permissible concentrations for drinking water (100 mg/l). The nitrate levels in this district are characterized by: (a) high concentrations compared to

neighbouring districts (attributed to the intensity of agriculture activity of an existing major irrigation project) (b) close to stable with minor declining trends (in the long term). The area is characterized by a rising watertable, indicating vertical recharge of return flow from irrigation. These water the nitrates from the unsaturated zone and into the groundwater.

Generally, the F concentrations in the district are high and not suitable for domestic uses.Fluoride average concentrations range from ~1 to ~4 mg/l in most of the blocks over the examined time period. Most of the time, concentrations are above the permissible limit for drinking (1.5 mg/l). Maximum concentrations are recorded in Rajgarh Block reaching up to 5 mg/l. Churu block seems to have a long term unchanged trend with relatively constant concentrations ranging between 1 mg/l and 2 mg/l, usually within permissible levels. Rajgarh and Tarangar Blocks show decreasing trends from 3 to 2 mg/l.

		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium

The above table depicts the salinity and sodium hazard status of ACZ IIa. In Gneisses, phyllite/schist and Tertiary sandstone aquifer units high salinity and medium sodium to very high salinity and high sodium class of water are present.

In Bilara limestone, Gneisses and younger alluvium aquifer units, high salinity and low /medium sodium to very high salinity and very high sodium water are occurring.

In Older alluvium unit the water classes for irrigation water use range from medium salinity and low sodium to very high salinity and very high sodium , whereas in Vindhyan sandstone irrigation water classes range from medium salinity and very high sodium to very high salinity and very high sodium.

It may be seen from map of classification of irrigation water of ACZ (Drawing No. ACZ II(a)-009), almost half of the area of ACZ mostly in its eastern part comprise good and excellent class irrigation water, whereas northern and western part bear high salinity /sodium rich class of water.

1.14 Groundwater Draft Village-wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ II(a). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Ground water Abstractions in ACZ II (a)

District Total			**379.96**	**102.42**	**482.38**
ACZ Total			**1,787.31**	**280.40**	**2,067.71**

Source: - Village wise Data of Tehsil, CGWB and RGWD

It may be observed from the above table that total abstractions for all uses in ACZ IIa is 2,067.71 Mm^3 which include 1,787.31 Mm^3 as agriculture draft and 280.40 Mm^3 as domestic and industrial draft.

A total of 38.03 Mm^3 are abstracted from Churu district part of the ACZ which include 32.10 Mm^3 as agriculture draft and 5.93 Mm^3 as domestic and industrial draft. The alluvium aquifer unit which amount to maximum abstraction of 28.11 Mm^3 in the district is in Rajgarh block.

In Jhunjhunun district part of the ACZ total 571.07 Mm^3 of ground water is abstracted which include 492.75 Mm^3 as agriculture draft and 78.32 Mm^3 as domestic and industrial draft. A maximum abstraction of 108.72 Mm^3 has taken place in Nawalgarh block and minimum 26.49 Mm^3 abstraction has occurred in Alsisar block. Among aquifer units maximum abstraction of 96.88 Mm^3 are obtained from older alluvium unit in Sanchore block of Jalore district.

A total of 976.23 Mm^3 are abstracted from Nagaur district part of the ACZ which include 882.50 Mm^3 as agriculture draft and the 93.73 Mm^3 as domestic and industrial draft. The maximum abstraction of 199.05 Mm^3 in Kuchaman city block have taken place in the district. Among aquifer units maximum abstraction of 194.27 Mm^3 are obtained from Older alluvium unit in Kuchaman city block of the district.

In Kuchaman city district part of the ACZ total 482.38 Mm^3 of ground water is abstracted which include 379.96 Mm^3 as agriculture draft and 102.42 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Danta Ramgarh block which amount to 84.87 Mm^3 and minimum 42.60 Mm^3 abstraction has occurred in Fatehpur block. Among aquifer unit maximum abstraction of 73.37 Mm^3 are obtained from older alluvium unit in Danta Ramgarh block of the district.

1.15 Static Groundwater Resources

1.15.1 Static Ground Water Resource (Fresh Ground Water)

The fresh static ground water resources of ACZ II (a) for year 2010 are given in Table 1.15-1.

District Total			**21.52**
ACZ IIa Total			**1,829.14**

Source: - CGWB and RGWD

Note: - Zero availability means negligible value

Out of the total assessed saline static ground water resources of 1,829.14 Mm^3 for the ACZ, 1,464.97 Mm^3 are present in Churu district, 23.12 Mm^3 in Jhunjhunun district, 319.53 Mm^3 in Nagaur district and 21.52 Mm^3 in Sikar district of the ACZ. The older alluvium aquifer unit in Rajgarh block of Churu district comprises maximum of 681.01 Mm^3 of saline static ground water resource in the ACZ.

1.16 Dynamic Ground water Resources

1.16.1 Dynamic Ground Water Resource (Fresh Ground Water)

The assessed net availability of fresh dynamic ground water resource, ground water abstraction for all type of uses, the stage of ground water development and category of development block for ACZ for year 2010 is shown in Table 1.16-1.

Table 1.16-1 Dynamic Ground Water Resources (2010) of ACZ II (a)

District	Block	Hydrogeological Unit	Net Groundwater Availability, Mm^3	Gross Draft for All Uses, Mm^3	Stage of Groundwater Development, %	Category

ACZ IIa Total			**1,082.83**	**2,067.71**	**190.95**	**Over Exploited**

Note: Zero availability means negligible value

It may be seen from the table that net ground water availability in the ACZ is assessed as 1,082.83 Mm^3 and draft for all types of uses as 2,067.71 Mm^3. This works out the stage of ground water development in ACZ as 190.95 % giving the zone a ground water over-exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ II(a) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ II(a)-010.

Of the total 29 blocks of the ACZ, 25 blocks in various districts covering the ACZ are categorised as ground water over-exploited blocks with stage of ground water development ranging from 104.72% (Jayal block, district Nagaur) to 422.97 % (Rajgarh block, district Churu). Of the remaining blocks 2 are categorised as Critical, 1 as Semi-Critical and 1 under Safe category.

1.16.2 Dynamic Ground Water Resource (Saline Ground Water)

The assessed net availability of saline dynamic ground water resource for the ACZ for year 2010 is shown in Table 1.16-2.

Table 1.16-2 Saline Dynamic Ground Water Resources (2010) of ACZ II (a)

District Total			**5.65**
ACZ IIa Total			**210.82**

Note: Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 210.82 Mm^3. The net ground water availability in Churu district part of the ACZ is 167.37 Mm^3 while that of Jhunjhunun district is 5.75 Mm^3. The net ground water availability in Nagaur district is 32.06 Mm^3 and that in Sikar district is

5.65 Mm^3. The maximum net ground water availability is in Taranagar block of Churu district and amounting to 105.52 Mm^3.

1.17 Assessment of Groundwater Availability

The net dynamic ground water availability at year 2010 in ACZ II (a) is 1,082.83 Mm^3 and ground water abstraction 2,067.71 Mm^3. The stage of ground water development in zone is 190.95% and is categorised as over-exploited zone. Saline ground water resource of the zone is assessed at 210.82 Mm^3.

The total static ground water resource in ACZ is assessed at 6,988.51 Mm^3, out of which 1,829.14 Mm^3 is saline ground water.

1. Groundwater Study of Agroclimatic Zone II (b)

1.1 General

The ACZ covers an area of 31,656.93 km^2 and comprises districts of Jalore, Pali, Sirohi and parts of Barmer and Jodhpur districts. The average annual rainfall in zone is 412.2 mm and mean annual evaporation 199 mm.

1.2 Geology

The ACZ II (b) in occupied with various group of rocks the chief being alluvium of Quaternary age. Granites, metamorphic and limestone rocks cover northern part of ACZ and also occur as isolated exposures in central part of ACZ. The southern and eastern parts of ACZ are occupied with Pre-cambrian rocks that constitute quartzite, phyllite, schist, gneiss and marble.

1.3 Hydrogeology

Hydrogeology of hydro-strategraphic units as aquifers occurring in ACZ is described in following paragraph. Area occupied by various aquifer units in different blocks and districts of covering ACZ is given in Table 1.4-1. Hydrogeology map of ACZ II (b) is at Drawing No. ACZ II(b)-001.

Alluvium

This hydrogeological unit consists of younger and older alluvium. The younger alluvium is mainly comprised of fluvial deposits that include sand, gravel, pebbles and cobbles with small amounts of silt and clay. The Older alluvium is a heterogeneous mixture of varying sizes of sand, silt, clay and kankar. It covers a large area in Jalore district and occurs in patches around Rohat, Sojat, Sumerpur and Jaitaran Blocks in Pali district. In Jalore district, the yield of dug wells tapping alluvium aquifer ranges from 0.72 to 1.74 lps, whereas in the case of tube wells it ranges from 0.93 to 6.48 lps. In Sirohi district, the yield of wells tapping alluvium ranges from 1.74 to 11.57 lps.

Jodhpur Sandstone

Jodhpur sandstone of Marwar Super Group occurs mainly in parts of Bilara and Bhopalgarh blocks of Jodhpur district. It is also found in a small area in Jaitaran block of Pali district. It comprises gritty sandstone and siltstone, intercalated with shales.

Jodhpur Sandstone forms a good aquifer. Groundwater in Jodhpur sandstone occurs under unconfined to semi-confined conditions. The yield of the wells tapping Jodhpur sandstone ranges from 0.35 to 2.08 lps whereas tube-wells yield from 0.77 to 4.24 lps.

Bilara Limestone

This unit is of dark-grey colour, hard, compact, dolomitic and cherty limestone. In Borunda – Bilara area the limestone is highly crumpled and cavernous and has an abnormally-high specific yield. It occupies extensive areas around Bhopalgarh and Bilara blocks of Jodhpur district and Jaitaran block of Pali district. In Phalodi area, the yield of tube-wells tapping limestone ranges from 0.77 to 3.09 lps. In Barunda area of

Bilara Tehsil, the limestone is highly cavernous, with yields of tube-wells ranging from 0.93 to 20.83 lps.

Jalore Granite

Granites cover a large area in Pali, Sirohi and Jalore districts. They are jointed and fractured and have low water yielding capacity. The yield of tube wells tapping granites as an aquifer in Jalore district area ranges from 0.23 to 2.18 lps, whereas in Sirohi district the yield of tube wells ranges from <1 lps to 2.89 lps.

Phyllite and Schist

This unit is Rocks dark-brown to purple, with bands of quartzite. Rocks are fractured, jointed and foliated and cover considerable areas in (a) Reodhar and Sirohi blocks of Sirohi district, (b) Sojat, Pali, Kharchi and Rohat blocks of Pali district.

The aquifer has low to moderate water-yielding capacity. In Jalore area, the yield of tube wells tapping Schist, Phyllite is poor, ranging from 0.35 to 0.93 lps. In Sirohi area, the yield of tube wells tapping these formations is slightly better and range from 0.35 to 2.89 lps.

Gneisses

These occupy a very small area along the foothills of the Aravalli range in the eastern periphery of Pali district, covering mainly Raipur block. Groundwater occurs in joints and fractures and has a low water yielding capacity in the area, ranging from 0.13 to 3.83 lps for tube wells.

Erinpura Granite

This aquifer is present in parts of Pali and Sirohi district of ACZ. The static water level (bgl) in the aquifer ranges from 3.33 m to 33.00 m. The yield of tube wells have a range from 2.5 to 8.33 lps for a drawdown of 6.00 m to 11.26 m.

Rhyolite

Rhyolites have very small exposures. No information about hydrogeological characteristics of the unit were available. This rock unit is however a very low water yielding formation of about 0.83 lps for tube wells.

1.4 Main Aquifers units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Table 1.4-1 Main Aquifer Units of ACZ II (b)

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 5 of Annex 2(b).

From Table 1.5-1 it may be observed that explored aquifer depth of Older alluvium aquifer unit of ACZ IIb ranges from 25m (village Rajanwadi, block and district Jalore) to 362.80 m (village Sarao, block Chitalwana, district Jalore); the SWL (bgl) from 2.50m (village and block Sumerpur, district Pali) to 65m (village Kuda, block Sanchore, district Jalore) and discharge from 0.13 lps (village Leelamba, block Marwa, district Pali) to 68.04 lps (Village Chatwara, block Sayla, district Jalore).

In Younger alluvium the explored aquifer depth ranges from 16m (Village Dhanta, block Raniwara district Jalore) to 310m (Village Jhab block Bhinmal, district Jalore); the SWL (bgl) from 0.40m (Mohabbat nagar, block Reodar, district Sirohi) to 65m (Village Punasa, block Bhinmal, district Jalore); and the discharge from 0.13 lps (Village Mohabbat Nagar, block Reodar, district Sirohi) to 73.30 lps (Village and block Sayla district Jalore).

In Sedimentary aquifers of ACZ IIb the average explored depth ranges from 40m (Village Manda, block Sojat, district Pali) to 283.77m (Village Jeti, block Bilara, district Jodhpur); the SWL (bgl) from 12m (Village Khari Beri, block Bilara, district Jodhpur) to 144m (Village Udalia block Bilara, district Jodhpur) and well discharge from 0.14 lps (Village Dhola, block Jaitaran, district Pali) to 75.70 lps (Village Pichak, block Bilara, district Jodhpur)

In Hard rock aquifers of ACZ IIb the explored depth ranges 9.45m (Village Chandawal, block Sojat district Pali) to 205.10m (Village Devnagar, block Bhopalgarh district Jodhpur); the SWL (bgl) from 0.35m (Village Gulabganj, block Reodar, district Sirohi) to 90m (Village Ransigaon, block Bilara, district. Jodhpur) and the discharge ranges from 0.04 lps (Village Jaitpura block Jaswantpura, district Jalore) to 21.67 lps (Village Charpatiya, block Raniwara, district Jalore).

1.6 Sub-surface Geology

Hydrogeological Cross- section A-A' (Mithura - Nimli)

The cross – section A-A' (Figure 1.6-1 and Figure 1.6-2) has been drawn from Mithura village in extreme North – western part of the ACZ to Nimli village in the north – eastern part of the Agroclimatic zone. Total length of the cross- section is 155 kms. The ground elevation ranges from RL 153 meters (Mitura) to RL 304 meters (Nimli) above mean sea level. The cross – section reveals that Older alluvium of Quaternary age comprising find sand, clay and kankar is occupying north – western and central part of the cross – sectional area while in north – eastern part alluvium is underlain by phyllite and schist aquifer unit of Delhi Super Group.

Ground water levels in the area ranges from 16 meters below ground level (Kulthana) to 54 meters below ground level (Mokalsar).

Figure 1.6-1 Hydrogeological Cross- Section Line of ACZ II(b)

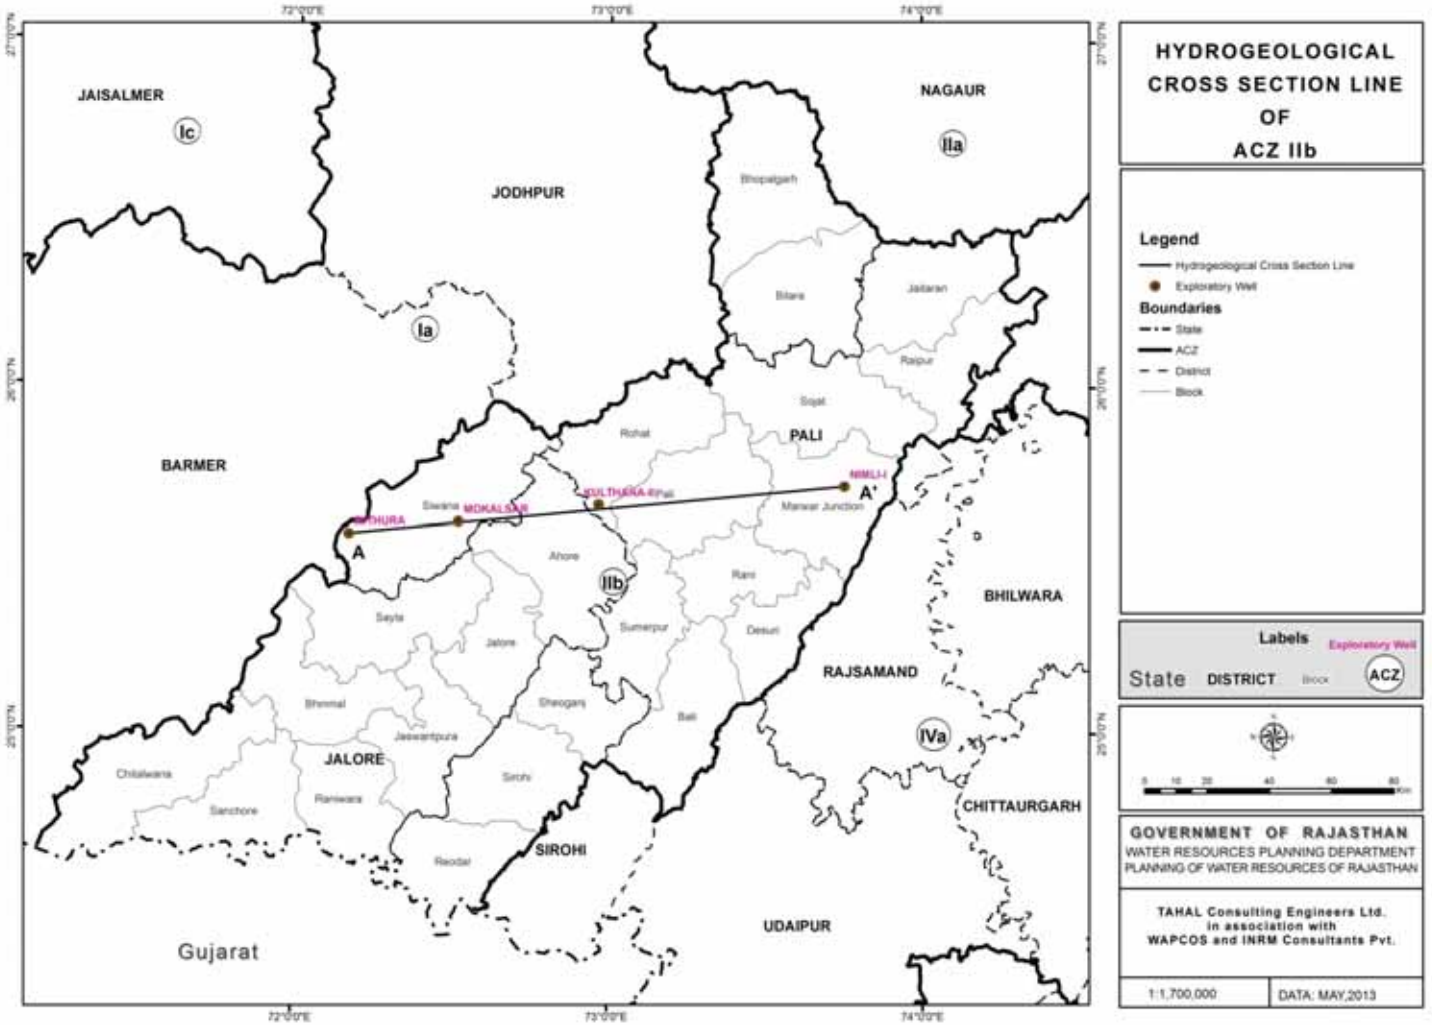

Figure 1.6-2 Hydrogeological Cross- section A-A' (Mithura – Nimli)

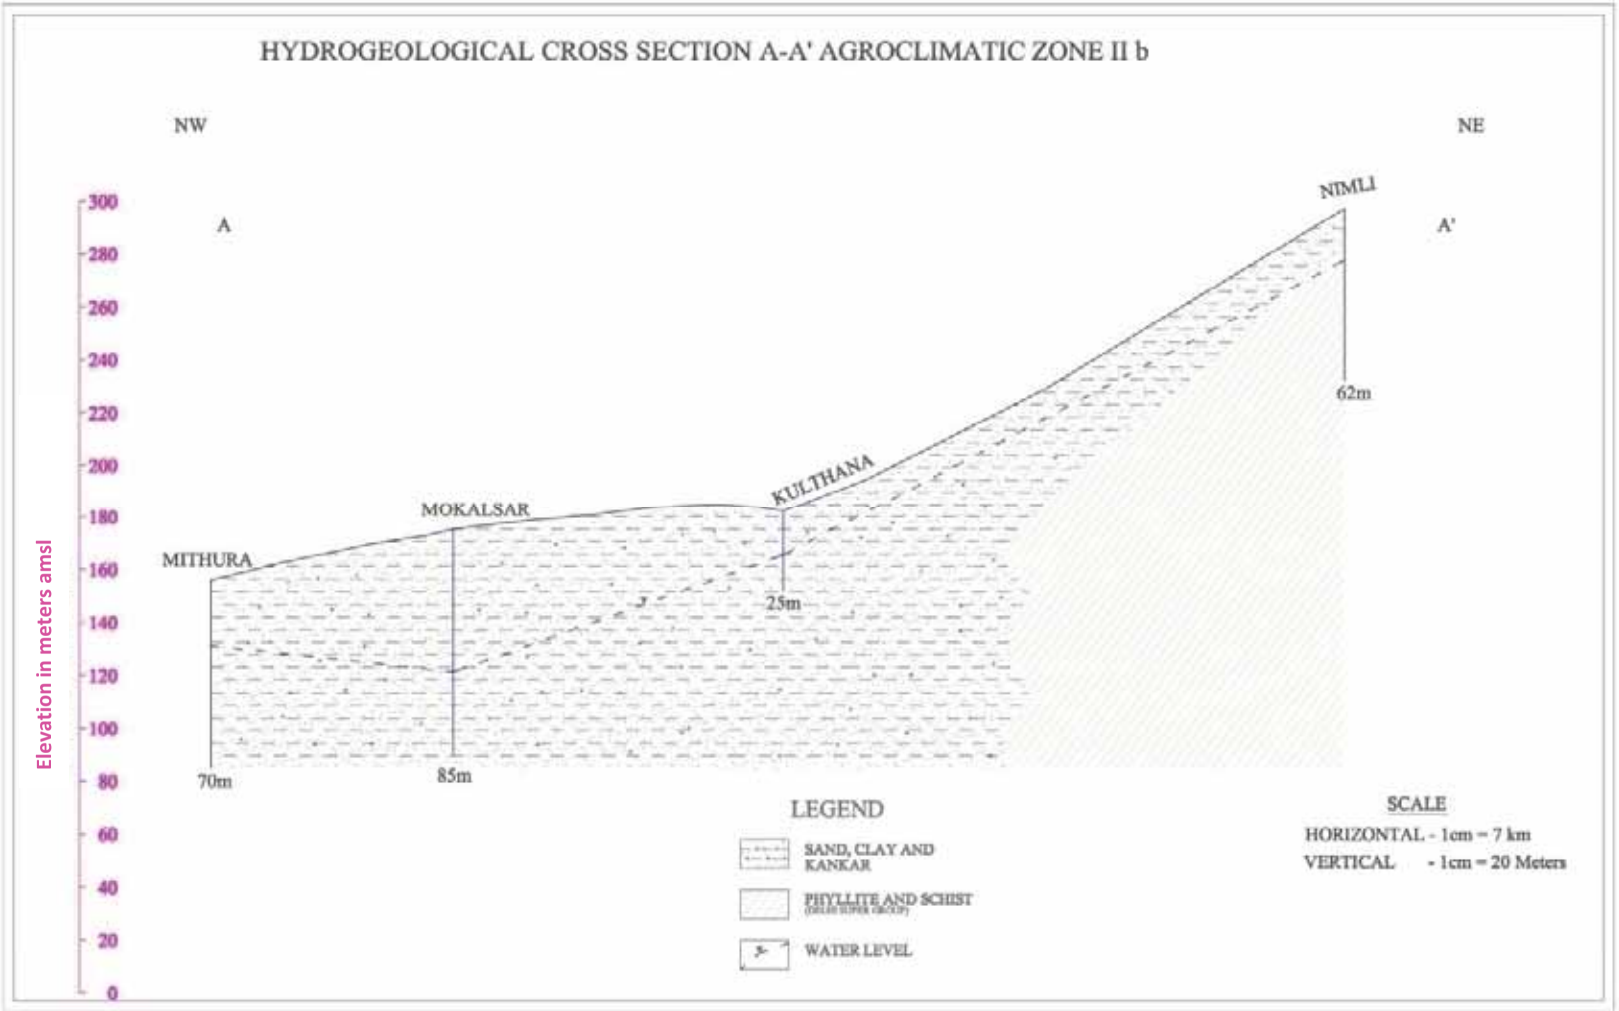

Source: - CGWB and RGWD

1.7 Depth to Groundwater

The pre-monsoon (2010) depth to ground water level of ACZ II (b) is placed at Drawing No. ACZ II(b)-003. Generally, it can be seen that depth to ground water levels (bgl) in this zone range from 5to 40m. Deeper levels of 60 to 100m depth exist in Siwana, Sayala and Rainwara blocks of Pali and Jalore districts.

The post-monsoon (2010) ground water level map of the ACZ is at Drawing No. ACZ II(b)-004. The existence of shallow ground water levels of less than 2m and between 2 to 5m (bgl) in to Rohat and Sojat blocks as seen in post-monsoon map of the ACZ testify to rise in levels sequel to infiltration of monsoon rainfall recharge in the area.

1.8 Ground water Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ II (b) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-wise/Aquifer-wise fluctuation in levels of ground water- ACZ II (b)

ACZ Summary			**565**	**-7.23**	**10.80**	**3.82**

Source: - CGWB and RGWD

As may be seen from the above table the average groundwater level fluctuation in Older alluvium aquifer of ACZ ranges from -0.16m in Chitalwana block of Jalore district to 4.33 m in Rohat block of Pali district. The average fluctuation of ground water level in Younger alluvium ranges from 0.16m in Sayla block of Jalore district to 5.45 m in Jaswantpura block of Jalore district. The above table also depicts that average ground water level fluctuation of sedimentary aquifers ranges 0.89 m (Bilara Limestone) in Bhopalgarh block of Jodhpur district to 4.80 m (Bilara Limestone) in Sojat block of Pali district. The average ground water level fluctuation in hard-rock aquifers ranges from 0.80 m (Rhyolite) in Raniwara block of Jalore district to 8.30 m (Erinpura Granite) in Sirohi block of Sirohi district.

1.9 Groundwater Levels and Flow Directions

The ACZ IIb constitutes about 50% of the Luni River Basin area, the Other Nallahs (of Jalore) River Basin and the Sukli River Basin, in the south. Two small patches of the Outside Basin in the north and the West Banas River Basin, in the south-east, are also included within this ACZ.

This delineated ACZ lies in the south-east on the northwest flank of the Aravallies, which is clearly displayed by the outline of water level contours (Map ACZ IIb-002). The hydraulic gradient there, and in the Sukli part of the ACZ, is very steep, about 10 – 20m per km since the water level along the summit of the range (see water level contours of the Banas River Basin on the other side of the range, ACZ IVa) is around 1000m ASL, and becoming more and more moderate getting away from the range due north-west. The groundwater "collector" there is the Luni River valley where the gradient is from m per km, in the alluvial aquifers to 5m per km and the contours converge towards and along the surface channels. In the Other Nallahs of Jalore Basin in the south the configuration of water level contours is similar, and on its face value there is no expressive reason to detauch it from the Luni River Basin.

The operative aquifers in this ACZ are the Older and Younger Alluvium, along and between the Luni channels, the Vindhyan Sandstone, the Bilara Limestone and for lesser extent - Quartzite, Rhyolite, Phyllite& Schist, Gneisses, Erinpura and Jalore Granites (Map ACZ IIb-001). These formations are not necessarily "aquifers" in the full sense of the term but many boreholes have been drilled into these rocks. The very moderate hydraulic gradient in the alluvial formations is not unexpected but in respect to the sandstone and limestone formations it may point to favourable transmissivity value and thick operative auriferous profile, virtually both.

Depth to groundwater level varies from less than 10m to 60 – 70m bgl in the north. Water levels are very shallow along the Luni River and its tributaries, such as in the Rohat and Pali blocks, as well as on the northwest flank of the Aravalies. Water depth of about 40 – 50m bgl is encountered in the Siwana and the Sayla blocks, within Older Alluvium high grounds in between Luni tributaries (Map ACZ IIb-003).

Both the water level depth and the moderate gradients, a rather dominating configuration west of the Aravallies that does not happen to exist east of the range, serve as a clear indication that the properties and thickness of the sedimentary aquifers, as well as the alluvial ones, are capable of maintaining deep and highly discharging production wells. This is not necessarily the situation in respect to the aquifers in the east, which are virtually perched on impervious to semi impervious formations or on top of the fresh, not weathered main bulk of the very same formations, and of limited thickness.

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ II(b) are shown in Figure 1.10-1 to 1.10-24. The supportive data for the same is given in Annex 9.

1.10.1 Sirohi District

The pre-monsoon average groundwater levels in Sirohi district in the year 1984 vary between a minimum of 252.11 m amsl (Sheoganj block) and maximum of 283.68 m amsl (Sirohi block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 236.26 m amsl (Sheoganj block) and a maximum of 275.06 m amsl (Sirohi block). Long term ground water levels in each block are presented in figures 1.10-1 - 1.10-3. The level change rates are given in Table 1.10-1.

In Sirohi, Sheogarh and Reodar blocks the pre-monsoon ground water level decline rates are (m/year): -0.24, -0.57 and -0.32 (respectively) and post-monsoon decline rates (m/year) -0.15, -0.43 and -0.21 (respectively; table 1.10-1). Groundwater level trend seems to have a good correlation to the seasonal rainfall trend (Figures 1.10-1 - 1.10-3).

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water level change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10.2). Accordingly, the most severe scenario is expected in Reoder block where average groundwater levels are predicted to reach 248.53 m amsl by the year 2060, ~14 m below current stages. As a result, 91% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.2 Pali District

The pre-monsoon average groundwater levels in Pali district in the year 1984 vary between a minimum of 201.14 m amsl (Rohat block) and maximum of 346.55 m amsl (Bali block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 197.23 m amsl (Rohat block) and a maximum of 338.11 m amsl (Bali block). Long-term groundwater levels in each block are presented in Figure 1.10-4 to 1.10-14.

In Pali district pre-monsoon groundwater level decline rates ranges between -0.08 m/year in Rohat Block and -0.43 m/year in Sojat Block whereas, post-monsoon ranges between -0.05 m/year in Rohat Block and -0.36 m/year in Jaitaran Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10.2). Accordingly, the most severe scenario is expected in Marwar Junction Block where average groundwater levels are predicted to reach 250.67 m amsl by the year 2060, ~19 m below current stages. As a result, 96% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.3 Jodhpur District

The pre-monsoon average groundwater levels in Jodhpur district in the year 1984 vary between a minimum of 237.73 m amsl (Bilara block) and maximum of 254.14 m amsl (Bhopalgarh block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 223.71 m amsl (Bilara block) and a maximum of 239.61 m amsl (Bhopalgarh block). Long term groundwater levels in each block are presented in Figures 1.10-15 - 1.10-16. The level change rates are given in Table 1.10-1

In Bilara Block of Jodhpur District, the rate of decline in pre-monsoon period is -0.56 m/year and in post-monsoon period it is -0.49 m/year. In Bhopalgarh Block of the district, the pre-monsoon decline is -0.43 m/year and post-monsoon decline is -0.42 m/year.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10.2). Accordingly, the most severe scenario is expected in Bilara block where average groundwater levels are predicted to reach 195.43m amsl by the year 2060, ~28m below current stages. As a result, 81% of the monitoring wells in the block will dry up (CGWB & RGWD).

1.10.4 Jalore district

The pre-monsoon average groundwater levels in Jalore district in the year 1984 vary between a minimum of 96.12 m amsl (Bhinmal block) and maximum of 199.36 m amsl (Jaswantpura block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 47.07 m amsl (Sanchore block) and a maximum of 184.94 m amsl (Jaswantpura block). Long-term ground water levels in each block are presented in figures 1.10-17 - 1.10-24 The level change rates are given in table 1.10-1. This district is located in downstream part of Luni River. Thus, the groundwater affected by the typical gradients characterizing this area. These gradients are relatively sharp in Bhinmal Block and become moderate in Chitalwana Block.

In Jalore District pre-monsoon groundwater level average change rates ranges between +0.004 m/year in Chitalwana Block and -1.17 m/year in Bhinmal Block. Post-monsoon rates ranges between -0.01 m/year in Chitalwana Block to -1.21 m/year in Bhinmal Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10.2). Accordingly, the most severe scenario is expected in Jaswantpura Block where average groundwater levels are predicted to reach 157.98 m amsl by the year 2060, ~24 m below current stages. As a result, 85% of the monitoring wells (CGWB & RGWD) in the Block will dry up.

1.11 Long-term drafts

Total draft in ACZ IIb present an unusual trend, showing a slight decrease in groundwater abstractions during the last 15 years. Total draft decreased from 1,875 Mm^3 in 1995 to 1,695 Mm^3 in 2009, a total decrease of 180 Mm^3 (Figure 1.11-1, Table 1.11-6). The relative decrease for the entire period was 9% with an average annual rate of -13 Mm^3/yr. Figure 1.11-1 presents the long term draft for available years (1995, 2001, 2004, 2007 and 2009). The main decrease takes place between 1995 and 2001 at Jalore and Pali districts, although some increase in draft was recorded in the other 3 districts (Sirohi, Jodhpur and Barmer, see Table 1.11-6). Figure 1.11-2 presents the long term draft according to the type of usage. The graph displays very clearly that all of the decrease in groundwater abstraction took place in the agriculture sector, while draft for domestic and industry increased during these years. Between 2001 and 2007 the groundwater draft keeps stable around ~1,600 Mm^3 for agriculture purposes and ~100 Mm^3 for domestic and industrial usages.

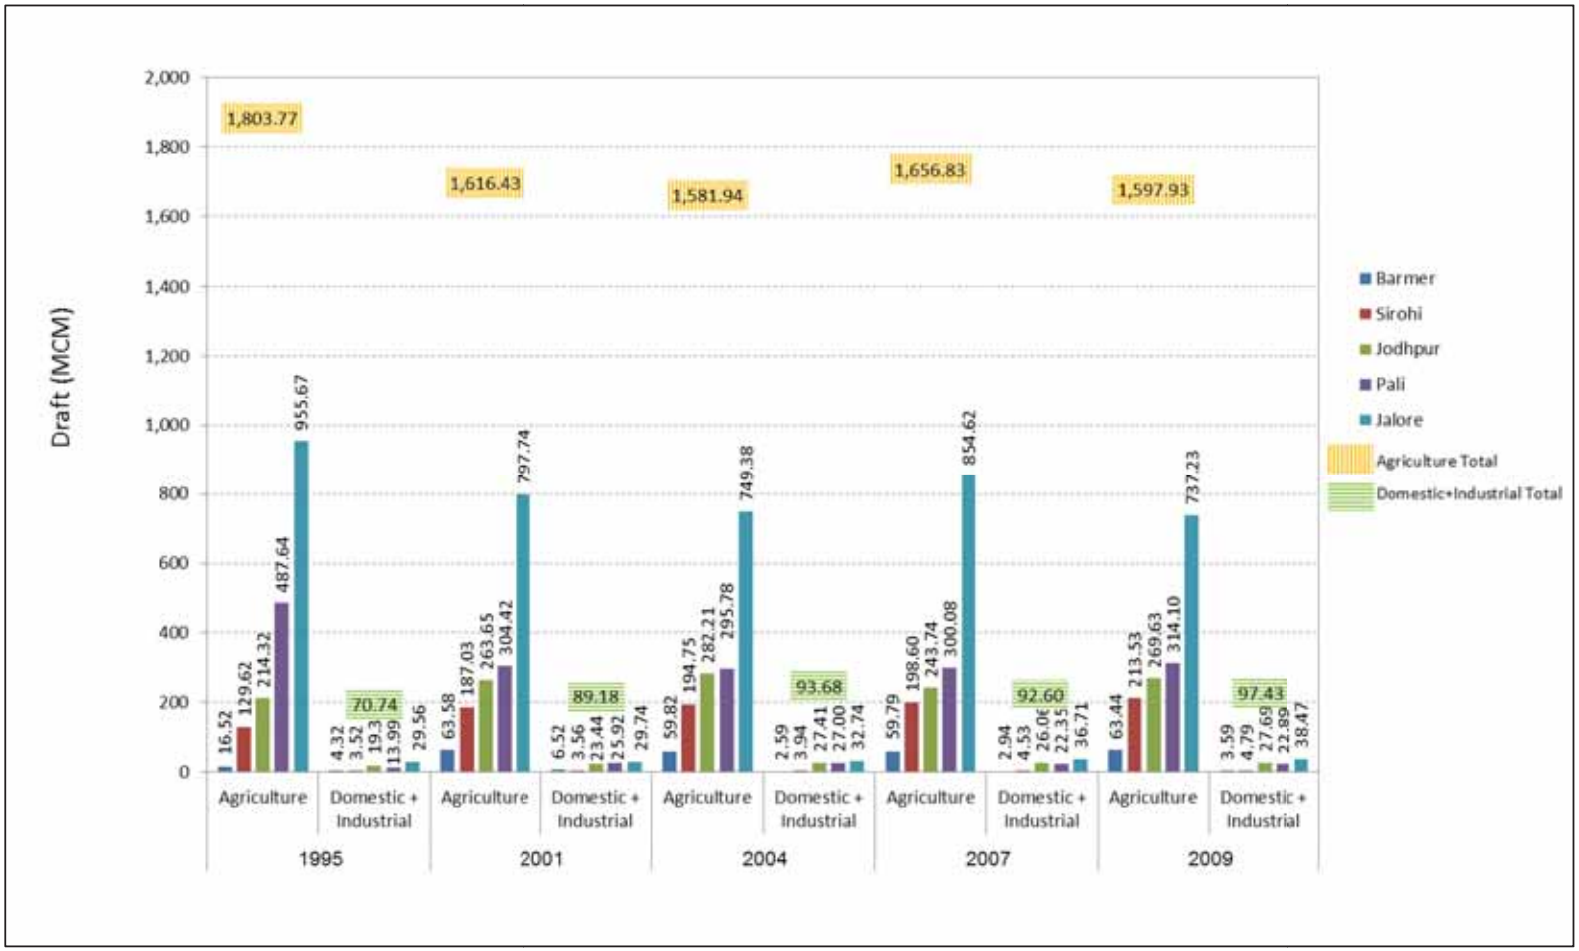
Source: CGWB and RGWD

Figure 1.11-2 Groundwater Draft for Agriculture and Others Uses in ACZ IIb by Districts



Source: CGWB and RGWD

1.11.1 Barmer District

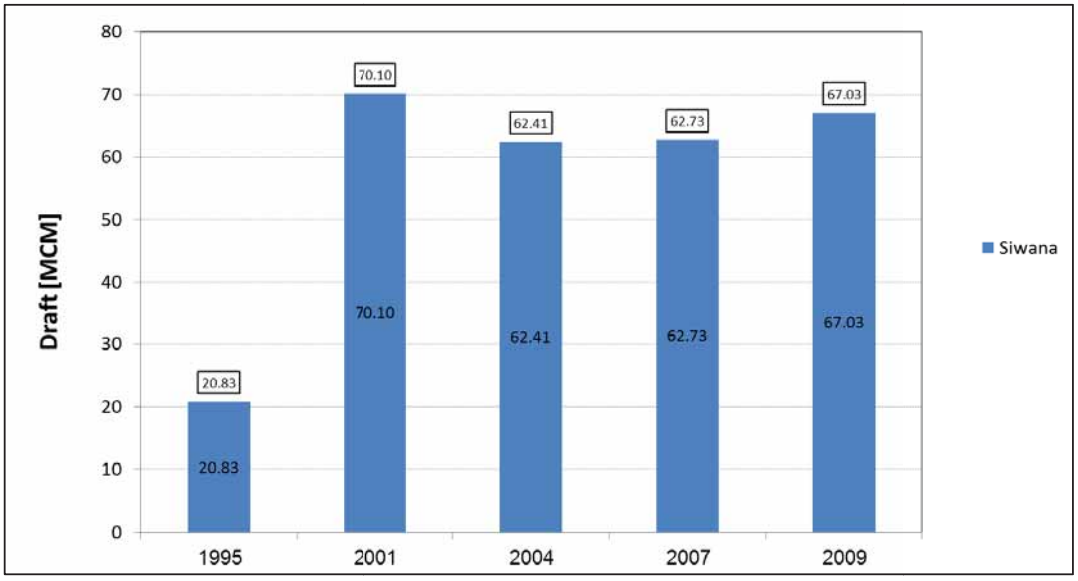
ACZ IIb includes only a single block – Siwana - belonging to Barmer district. Groundwater draft in this block reached 67 Mm^3 during 2009 which comprise only ~3% out of the total draft in the ACZ. Figure 1.11-3 presents the long term draft in Siwana block for the years 1995-2009. Between the years 1995 and 2001 a significant increase was recorded, from 21 Mm^3 to 70 Mm^3, a rise of 222% (Figure 1.11-3, Table 1.11-1 and Table 1.11-6). From 2001 to 2009 the draft keeps stable between 62 Mm^3 to 70 Mm^3. The rise in groundwater draft is attributed entirely to the agricultural consumption while domestic and industrial consumption registers a decline of 17% over the period examined.

Table 1.11-1 Total Change in Groundwater Draft - Barmer District (within ACZ IIb) 1995 - 2009 (%)

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change	Remarks
Siwana	+284%	-17%	+222%	During 1995 there was almost no agricultural draft

Source: CGWB and RGWD; Supportive data is located in Table 1.11.6

Figure 1.11-3 Groundwater Abstraction in Barmer District (within ACZ IIb) by Blocks



Source: CGWB and RGWD

1.11.2 Jalore District

Groundwater draft in this district reached 776 Mm^3 during 2009 that comprise ~46% out of the total draft in the ACZ. Between the years 1995 and 2009 draft values declined from 985 Mm^3 to 776 Mm^3, a relative decline of 21% (Figure 1.11-4). It should be noticed that the decline takes place only in the agriculture consumption while the domestic and industrial consumption rise significantly (+30%) during the examined period. However, domestic and industrial drafts

consist only a negligible fraction of the total draft in the district ranging between 3% (1995) to 5% (2009; Table 1.11-6). The main abstractions in this district are taking place in Sayla and Bhinmal blocks, >140 Mm^3 each. Minimum exploitation was recorded in Ahore block, 33 Mm^3 in 2009. Decrease in draft for the entire period range between 14% in Sayla block and a maximum of 34% in Ahore Block. The draft per area ratio is relatively high throughout the whole district, especially in the blocks of Sayla, Bhinmal and Raniwara in which the rates reach 0.1 to 0.2 Mm^3/km^2 an order of magnitude higher than the average in the state.

Table 1.11-2 Total Change in Groundwater Draft in Jalore District from 1995 to 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Ahore	-38%	+11%	-34%
Bhinmal	-27%	+67%	-26%
Chitalwana	-22%	+24%	-21%
Jalor	-34%	+47%	-31%
Jaswantpura	-21%	+29%	-19%

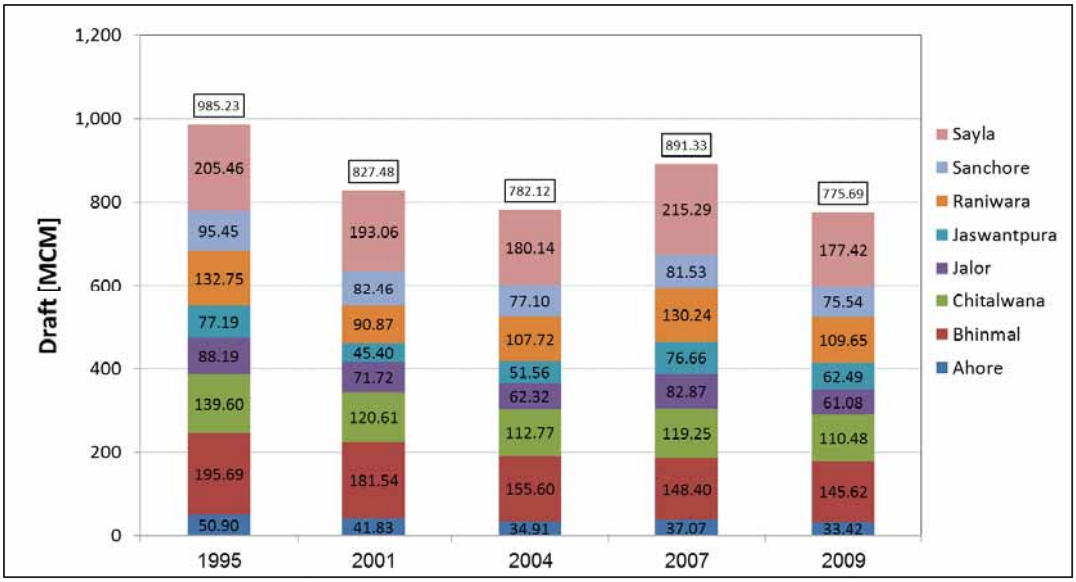
Figure 1.11-4: Groundwater draft in Jalore District (within ACZ IIb) by Blocks



Source: CGWB and RGWD

1.11.3 Jodhpur District

Groundwater draft in this district reached 297 Mm^3 during 2009 which comprise ~15% of the total draft in the ACZ. Between 1995-2009 groundwater draft increased by 27%, from 234 Mm^3 in 1995 to 297 Mm^3 in 2009. The main increase took place in Bhopalgarh block, with a rise of 127% in domestic and industrial drafts and 40% rise in the agriculture draft (Table 1.11-3). The draft per area ratio is about half of the value in Jalore district (0.09 to 0.1 Mm^3/Km^2; Figure 8.8).

Table 1.11-3 Total Change in Groundwater Draft in Jodhpur District from 1995 to 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bhopalgarh	+40%	+127%	+44%
Bilara	+12%	+14%	+12%
District Total	**+26%**	**+43%**	**+27%**

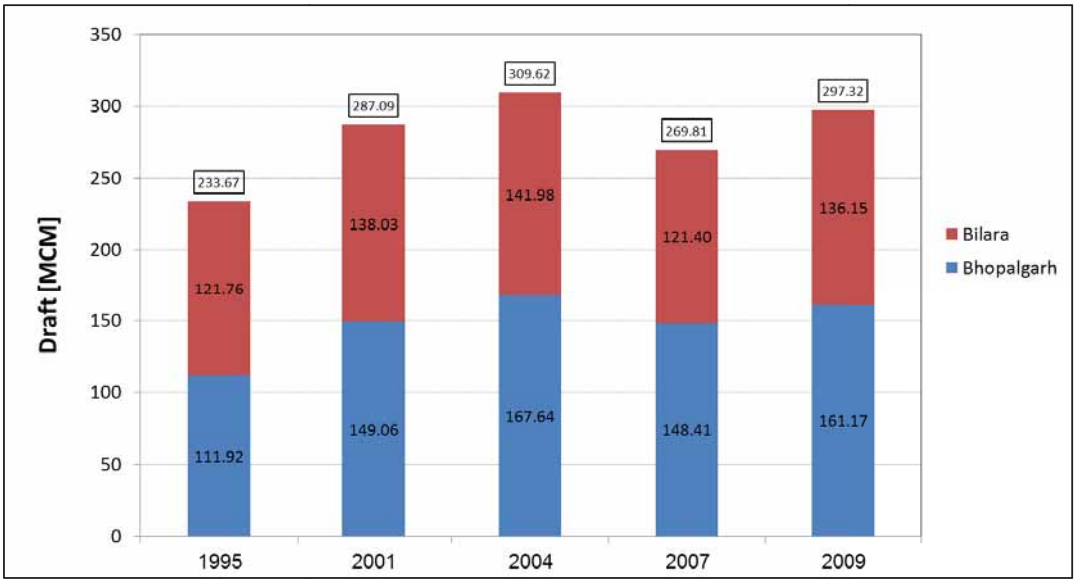
Figure 1.11-5 Total Groundwater Draft in Jodhpur District (within ACZ IIb) by Blocks



Source: CGWB and RGWD

1.11.4 Pali District

The groundwater draft in this district during 2009 stands on 337 Mm^3 and comprise ~20% of the total draft in the ACZ. Between 1995 and 2001 a sharp decline in groundwater exploitation took place from 502 Mm^3 to 330 Mm^3, a drop of almost 35% in six years (see Figure 1.11-6, Table 1.11-6). This pattern was recorded in all the blocks in the district. From 2001 to 2009 the total draft in the district stayed stable (Figure 1.11-6, Table 1.11-6). Regardless of the overall recorded decrease, significant increase in the domestic and industrial

sector were recorded. All blocks (except Pali) recorded a rising trend in this sector ranging from 4% in Marwar Junction block to 251% rise in Rani block. The main consumers in 2009 are Bali, Jaitaran, Marwar Junction and Sumerpur blocks, >45 Mm^3 each.

Table 1.11-4 Total Change in Groundwater Draft in Pali District from 1995 to 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bali	-36%	+22%	-35%
Desuri	-55%	+107%	-52%
Jaitaran	-31%	+139%	-26%
Marwar Junction	-46%	+4%	-44%
Pali	+19%	-47%	+17%
Raipur	-51%	+32%	-48%
Rani	-44%	+251%	-40%
Rohat	+51%	+88%	+52%
Sojat	-41%	+47%	-38%
Sumerpur	+16%	+135%	+19%
District Total	**-36%**	**+64%**	**-33%**

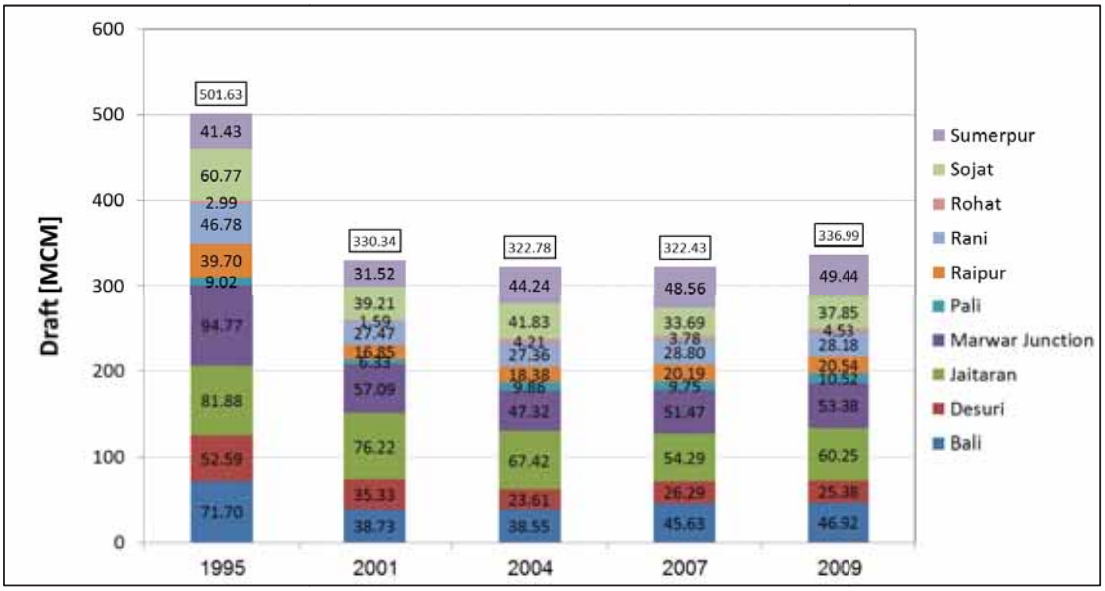
Figure 1.11-6 Total Groundwater Draft in Pali District (within ACZ IIb) by Blocks



Source: - CGWB and RGWD

1.11.5 Sirohi District

The groundwater draft in this district during 2009 was 218 Mm^3 which comprises ~13% out of the total draft in the ACZ. Groundwater draft increased from 133 Mm^3 in 1995 to 218 Mm^3 in 2009, a relative rise of 63% (Table 1.11-5). All three blocks present similar volumes of abstractions ranging between 65 and 85 Mm^3 in 2009. Sheoganj block displays the highest increase rate for the

entire period, reaching above 100% in only 15 years. Groundwater draft increased by 73% in Sirohi block and by 36% in Reodar block (Table 1.11-5). The significant increase in Reodar block took place in the domestic and industrial sector, unlike the other 2 blocks, where most of the increase was recorded in the agriculture consumption. Increase in draft took place constantly throughout the entire period in both sectors (agriculture and domestic and industrial see Table 1.11-2). Draft per area ratio values are high though typical to this part of the ACZ and range between 0.05 and 0.08 Mm^3/km^2 in all blocks (Map 8.8).

Table 1.11-5 Total Change in Groundwater Draft in Sirohi District 1995 - 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Reodar	+35%	+91%	+36%

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 2249 villages in ACZ II(b), 397 are found suitable for drinking water use, 845 for irrigation use and 1695 for livestock water use. The details of village-wise assessment of ground water quality are shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in ground water is summarised in Table 1.12-1.

Table 1.12-1 Village and Block wise Water Quality

ACZ	District	Block	Total Number of Villages	Electrical Conductivity, µS/cm			Chloride, mg/l			Fluoride, mg/l			Nitrate, mg/l

Source: - CGWB and RGWD

It may be seen from above that out of 2249 villages of ACZ IIb, 516 fall under desirable, 1001 under maximum permissible limit and 732 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 317 while number of villages with maximum permissible limit of use is 313 and number of above maximum permissible limit for Fluoride is 1619. As regards presence of nitrate in ground water, 855 fall under highest desirable limit of less than 45 mg/l and 854 under maximum permissible limit along with 540 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 726 villages fall under maximum permissible limit and 1404 under above maximum permissible limit of 2250 microhos/cm and 119 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

i) Ground Water Quality of ACZ II (b) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ II(b) is shown in Drawing No. ACZ II(b)-005. Fresh ground water with less than 250 mg/l chloride concentration occurs along eastern border of ACZ in Pali district occupied by granite and gneiss rocks and in southern part of ACZ in Sirohi district occupied by alluvium and Phyllite rock units. Isolated pockets of fresh ground water also occur in central and northern parts of ACZ. Ground water aquifer viz. Granites, Phyllite and Gneiss and Alluvium in north-central, central and south-western parts of the ACZ in Sojat and Rohat blocks of Pali district; Jalore, Ahore, Sanchore, Sayla blocks of Jalore district have high levels of chloride beyond 1000 mg/l.

Block-wise / aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in Table 1.12-2.

Table 1.12-2 Percent Area Occupied with Various Level of Chloride in Ground Water of ACZ II (b)

ACZ IIb Summary			**19.23**	**44.92**	**35.85**

Source: - CGWB and RGWD

From the above table, it is revealed that only 7 to 36% area in different districts of ACZ bear potable quality ground water with chloride value of <250 mg/l. Poor quality of ground water with Chloride value from 250 to 1000 mg/l or beyond belong to Erinpura granite in Jaitaran block, Bilara Limestone in Sojat block , Younger alluvium in Pali block of Pali district; Phyllite/Schist in Bilara block of Jodhpur district; Younger alluvium in Chitalwara block and Rhyolite in Raniwara block of Jalore district.

ii) Ground Water Quality of ACZ II (b) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ II(b) is shown in Drawing No. ACZ II(b)-006. Except for a few pockets in southern, south-western part (Jalore district) and northern part (Sojat block, Pali district) of the ACZ, the ground water is generally of good quality with concentration of NO_3 within 45 mg/l and 100 mg/l.

Block-wise / aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

Table 1.12-3 Percent area occupied with various level of Nitrate in ground water of ACZ II (b)

ACZ IIb Summary			**32.64**	**39.63**	**27.73**

Source: - CGWB and RGWD

From the above table it is revealed that the area with ground water of nitrate value less than 45 mg/l to 100 mg/l is ranging from 52.8% (Barmer district) to 86.99 % (Pali district). It is also depicted from the table that younger alluvium aquifer unit in Sojat block of Pali district and Rhyolite aquifer unit in Raniwara block of Jalore district are fully infested with NO_3 concentration for more than 100 mg/l.

iii) Ground Water Quality of ACZ II (b) by fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ II(b) is shown in Drawing No. ACZ II(b)-007. It may be seen from the map that a large part of the ACZ, is occupied by non-potable quality ground water with fluoride concentration beyond 1.5 mg/l. A small part of different aquifer units in Bhopalgarh block of Jodhpur district in northern part, Siwana block of Barmer district in western part and around Bali block of Pali district in south-eastern part bear potable ground water.

Block-wise / aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

Table 1.12-4 Percent area occupied with various level of Fluoride in ground water of ACZ II (b)

ACZ IIb Summary			**12.38**	**15.35**	**72.27**

Source: - CGWB and RGWD

It may be seen from above table that about 72% area of ACZ is faced with poor quality ground water with 100% area pertaining to Jalore Granite aquifer unit in Bhinmal block of Jalore district; Gneisses aquifer unit in Bali block, Erinpura Granite aquifer unit in Jaitaran block, Younger alluvium aquifer unit in Pali and Sojat blocks and in Erinpura Granite aquifer unit in Rohat block of Pali district.

iv) Ground Water Quality of ACZ II (b) by EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ II(b) is shown in Drawing No. ACZ II(b)-008. The northern part of ACZ in Pali and Jodhpur districts bear high salinity level ground water with EC concentration of 2250-5000

micromhos/cm and beyond 5000 micromhos/cm. The south-western parts of ACZ occupied with alluvium also bear high salinity ground water.

The ACZ area in parts of Sirohi and Barmer district have low salinity ground water with EC of less than 2250 micromhos/cm.

Block-wise/aquifer-wise percent area occupied with various levels of EC in groundwater of ACZ is shown in Table 1.12-5.

Table 1.12-5 Percent area occupied with various level of EC in ground water of ACZ II (b)

ACZ IIb Summary			**4.54**	**28.56**	**39.16**	**27.74**

Source: - CGWB and RGWD

From table, it is revealed that 66.9% area of the ACZ has high salinity ground water with EC concentration of 2250 to 5000 micromhos/cm or more, while low salinity ground water with EC concentration between <750 and 2250 micromhos/cm is 33.1% only. The table also depicts that Phyllite/schist aquifer unit in Bilara block of Jodhpur district; Erinpura Granite aquifer unit in Jaitaran block and Younger alluvium aquifer

unit in Pali block of Pali district is fully infested by high salinity ground water with EC range of 2250 to more than 5000 micromhos/cm.

1.12.3 Long term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ II(b) are shown in Figure 1.12-1 to 1.12-48. The supportive data for the same is given in Annex 10.

Barmer District (Siwana block)

Average chloride and EC concentrations for the period 1990-2009 are presented in Figure 1.12-1. The graphs demonstrate a good correlation between the two parameters. Average concentration fluctuated between 400 mg/l to 900 mg/l but usually don't exceed 600 mg/l. Chloride concentrations in this block are lower than the adjacent blocks, such as Ahore and Rohat where values are above 1,000 mg/l, probably due to the relatively high depth to groundwater in this region (60-80 m bgl compared to 20-40 m bgl). Multi-year trend is relatively stable in contrast to the general salinization processes observed in this area.

EC trends follow the chloride trends mentioned above. Average EC levels in the district are regularly between 2,000 and 3,000 µS/cm, slightly above the permissible limit for drinking (2,250 µS/cm). Similarly to Cl, EC levels are low compared to the surrounding blocks. The long term trend is relatively stable. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ II(b)-009.

Average NO_3 and F levels for the period 1990-2009 are presented in Figure 1.12-2. Average NO_3 concentrations increase from below 200 mg/l to over 300 mg/l. Those values are slightly high compared to the average levels in ACZ-II band are at the southeastern edge of an extensive nitrate plume found in Barmer district to the northwest.

Fluoride concentrations are presented in Figure 1.12-2, along with the nitrates. In general, concentrations in the district fluctuate between 1-2 mg/l. Long term trend are stable with a negligible decline of ~0.005 mg/l/y. Fluoride values are relatively low compared to neighboring areas.

Jalore District

Average chloride and EC concentrations per block for the period 1984-2009 are displayed in Figures 1.12-3 to 1.12-17 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary between a minimum of below 400 mg/l in Raniwara and Jaswantpura blocks at the south eastern edge of the district to a maximum of above 2,000 mg/l in Chitalwana block at the south western edge of district around the Luni river estuary. High values of above 1,000 mg/l were recorded also along the Luni river bed. The long term trends vary widely between a sharp increase of above 18 mg/l/y at Sanchore and Jalore blocks to a decrease of >20 mg/l/y at Chitalwana block. Salinity trends change from block to block, however it seems that low chloride levels (such as in Raniwara and Jaswantpura blocks)are usually more stable in the long term and present a smaller fluctuation range, whereas, high levels are affiliated with less stability and higher fluctuations. From spatial perspective one can see that at the western part of the District around Luni river bed chloride concentration are higher. This area characterizes by alluvial formations and exceptional ground water drop of above -0.5 m/y. These characteristics indicate that chloride pollution sources are the result of return flow from irrigation and enhanced by the high transmissivity of the aquifer. Moreover at Chitalwana block in which depth to groundwater is extremely shallow, chloride values are particularly high,(less than 10 m bgl).In contrast, at the upstream sections, the depth to the water table is significantly higher while groundwater salinity is considerably lower.

EC trends follow the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly between 2,000 and 8,000 µS/cm; much higher than the permissible limit for drinking. Minimum concentrations were recorded in Raniwara and Jaswantpura blocks (2,000 to 4,000 µS/cm) while maximum (average) concentrations are observed in Jalore and Chitalwana blocks, reaching as high as 8,000 µS/cm. Long term trend behave similarly to the chloride and so the spatial distribution.

Average NO_3 and F levels per block for the period 1984-2009 are displayed in Figures 1.12-4 to 1.12-18 (even figures). Average NO_3 concentrations in most blocks are between 100 and 200 mg/l; around the permissible limit for drinking (100 mg/l). Minimum values of ~80 mg/l were recorded at Ahore block, while maximum values of almost 300 mg/l are observed at Chitalwana block. Chitalwana block is found at the lower Luni section, where groundwater is shallow and the transmissivity of the alluvial aquifer is high. These conditions enhances the infiltration of nitrates into the groundwater with little decay in the soil. At the rest of the district nitrate variations are low and the long term trends are relatively stable.

Fluoride concentrations are presented in Figures 1.12-4 to 1.12-16, along with the nitrates. In general, concentrations in the district fluctuate between 1-4 mg/l. In most blocks, most of the time, F levels area above the permissible limit for drinking (1.5 mg/l) and there is moderate decline trend. In Ahore and Jalore blocks values are relatively higher and exceed 5 mg/l.

Jodhpur District

Average chloride and EC concentrations per block for the period 1984-2009 are displayed in Figures 1.12-19 to 1.12-21 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary between a minimum of below 600 mg/l in Bhopalgarh block at the northern edge of the ACZ to maximum of almost1, 600 mg/l in Bilara block. Long term trends display an increase in both blocks, yet in Bilara block the rate is an order of magnitude higher than in Bhopalgarh block and reach almost 25 mg/l/y (highest in the entire ACZ). Shallow depth to groundwater (<10 m bgl) and high hydraulic conductivity of the alluvial formation at the southern part of this block are both dominant factors controlling the salinity of the aquifer. The salinization processes are expected to be intensified by the high 'draft to area' ratio in this area.

EC trends follow the chloride trends mentioned above. Average EC levels in the district are regularly between 4,000 and 10,000 µS/cm; much higher than the permissible limit for drinking (2,250 µS/cm). Similarly to chloride, Minimum concentrations were recorded in Bhopalgarh (below 2,000 µS/cm) while maximum (average) concentrations are observed in Bilara, reaching as high as 10,000 µS/cm. Spatial distribution behave similarly to the chloride.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figures 1.12-20 to 1.12-22 (even figures). Average NO_3 ranges between 100 to 200 mg/l; above permissible limit for drinking (100 mg/l). Peak values were recorded in Bhopalgarh block and reach300 mg/l (1990-1994). Long term trend kept stable in both blocks. Trend and values are both typically to this part of the state. High nitrate concentrations are found at the border between the blocks. These are the eastern margin of large nitrate plume located to the west in Mandor Block.

Fluoride concentrations are presented in Figures 1.12-19 to 1.12-22, along with the nitrates. In general, concentrations in this part of the district fluctuate between 1-4 mg/l. In most of the time, F levels are above the permissible limit for drinking (1.5 mg/l). Both blocks recorded a moderate long term decline trend of ~0.02 mg/l/yr.

Pali District

Average chloride and EC concentrations per block for the period 1984-2009 are displayed in Figures 1.12-23 to 1.12-41 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary widely between a minimum of below 200 mg/l in Bali and Desuri blocks at the south-eastern part of the district-adjacent to western slopes of the Aravalis, to maximum of almost 2,000 mg/l (permissible limit for drinking is 1,000 mg/l) in Sojat Rohat and Pali blocks at the middle and western part of the district, around the northern tributaries of the Luni. Long term trends range from a significant increase rate of ~15 mg/l/y at the western and middle blocks to stable conditions or negligible increase at the eastern blocks. An examination of the spatial distribution of chlorides displays a clear connection between the depth of the water table and chloride concentrations. At the Western and central parts of the district, along the river tributaries, groundwater is shallow and often do not exceed 5 m bgl. Therefore, the vulnerability of the aquifer is high (few major and medium irrigation projects are found in this area, like Sardar-Samand and Hemawas-Bund). In contrast, at the mountainous areas at the eastern part of the district, depth to the groundwater is higher (20 to 40 m bgl) and therefore the aquifer is less exposed to salinization process.

EC trends follow the chloride trends mentioned above in most of the blocks. Average EC levels in the district vary widely between 2,000 and 20,000 µS/cm; much higher than the permissible limit for drinking. Minimum concentrations were recorded in Desuri and Bali blocks (2,000 to 4,000 µS/cm) while maximum (average) concentrations are observed in Sojat and Rohat blocks, reaching as high as 20,000 µS/cm. An EC plums found at the western and middle parts of the district and is the most severe in the entire state. Salinization processes in this area continue at a moderate to high rate, ranging from ~60 µS/cm/y in Sumepur block at the southern fringes of the patch and up to >300 µS/cm/y in Rohat block at the centre of the plume.

Average NO_3 and F levels per block for the period 1984-2009 are display in Figures 1.12-24 to 1.12-42 (even figures). Average NO_3 concentrations in most blocks are between 50 and 150 mg/l; around the permissible limit for drinking (100 mg/l). Minimum values of below 50 mg/l were recorded at Junction and Rohat blocks, Maximum values of almost 300 mg/l took place at Pali and Marwar-Junction blocks. Moderate long term trend of +0.5 mg/l/yr to almost +4 mg/l/yr took place along all blocks. Raipur block displays a higher increase rate of above 6 mg/l/yr from 35 mg/l in 1988 to >400 mg/l at the beginning of the decade.

Fluoride concentrations are presented in Figures 1.12-24 to 1.12-42, along with the nitrates. Spatial view shows that at the middle and western parts of the blocks F concentration is high and reaches maximum values of 4-5 mg/l at Pali and Sojat blocks. Yet long term trend in those areas recorded significant decline of 0.07 mg/l/yr and from the beginning of the decade values typically do not exceed 3 mg/l. At the eastern parts of the district recorded values are between 1 to 3 mg/l and the long term trend keeps stable or records a moderate decline.

Sirohi District

Average chloride and EC concentrations per block for the period 1984-2009 are displayed in Figures 1.12-43 to 1.12-47 (odd figures). The graphs show good correlation between the two parameters in all the blocks. Average concentrations vary between a minimum of below 200 mg/l in Reodar at the southern part of the district to a maximum of above800 mg/l (permissible limit for drinking is 1,000 mg/l) in Sheoganj block in the north. Long term trends are increasing in rate of ~7 mg/l/yr at the northern and middle parts of district around Sirohi and Sheoganj blocks. While at the south values keep stable. Chloride concentrations in this district and particular in the south are the lowest in the ACZ, which stands in correlation to the relatively deep groundwater (20-60 m bgl) in this area.

EC trends follow the chloride trends mentioned above. Average EC levels in the district are regularly between 1,500 and 4,000 µS/cm (permissible limit for drinking is 2,250 µS/cm). Similarly to chloride, Minimum concentrations were recorded in Reodar (below 1,000 µS/cm) while maximum (average) concentrations are observed in Sheoganj, reaching almost 4,000 µS/cm. Spatial distribution behave similarly to the chloride.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figures 1.12-44 to 1.12-48 (even figures). Average NO_3 varies between a minimum of~25 mg/l in Reodar block to maximum of ~140 mg/l in Sirohi block. All blocks recorded a gradual increase in the long term of >2 mg/l/y. Most of the time concentrations are between the desirable and permissible limit (45-100 mg/l).

Fluoride concentrations are presented in Figures 1.12-14 to 1.12-48, along with the nitrates. In general, concentrations in this part of the district fluctuate between 1-3 mg/l. Most of the time F levels are above the permissible limit for drinking (1.5 mg/l). The long term trends in Reodar and Sheoganj blocks are stable while in Sheoganj moderate decline of ~0.04 mg/l/y was recorded.

1.13 Groundwater Suitability for Agriculture

The aquifer classification of irrigation water in report of ACZ II(b) is shown in Table 1.13-1.

Table 1.13-1 Aquifer Classification of Irrigation Water

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
1	Bilara Limestone	C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
2	Erinpura Granite	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
3	Gneisses	C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
4	Jalore Granite	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
4	Jalore Granite	C_4S_4	Very High Salinity & Very High Sodium
5	Older Alluvium	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
6	Phyllite & Schist	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
7	Rhyollite	C_3S_3	High Salinity & High Sodium
8	Vindhyan Sandstone	C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
9	Younger Alluvium	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
9	Younger Alluvium	C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium

The above table reveals that irrigation water classes having range from high salinity and medium sodium to very high salinity and very high sodium are existing in Gneiss, Bilara limestone and Vindhyan sandstone aquifer units. Medium salinity and Medium sodium to very high salinity and very high sodium class water is occurring in Erinpura granite, Jalore granite aquifer units of ACZ.

In Older alluvium, phyllite/schist and Vindhyan sandstone aquifer units the irrigation water classes have a range from medium salinity and medium sodium to very high salinity and very high sodium.

High salinity and high sodium class water exists only in Rhyolite aquifer unit of ACZ.

As may be seen from classification of irrigation water map of ACZ II(b) shown at Drawing No. ACZ II(b)-009, western, southern and central parts of ACZ have good and excellent classes of irrigation water and remaining northern, western and central parts variously bear bad quality irrigation water classes.

1.14 Groundwater Draft Village-wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ II(b). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Ground Water Abstractions in ACZ II(b)

ACZ IIb Total			**1,657.33**	**131.36**	**1,788.69**

Source: - Village wise Data of Tehsil, CGWB and RGWD

It may be observed from the above table that total abstractions for all uses in ACZ IIb is 1788.69 Mm^3 which include 1,657.33 Mm^3 as agriculture draft and 131.36 Mm^3 as domestic and industrial draft.

A total of 71.14 Mm^3 are abstracted from Barmer district part of the ACZ which include 65.57 Mm^3 as agriculture draft and 5.57 Mm^3 as domestic and industrial draft. The alluvium aquifer unit amounts to maximum abstraction of 64.08 Mm^3 in the district.

In Jalor district part of the ACZ total 872.82 Mm^3 of ground water is abstracted which include 824.71 Mm^3 as agriculture draft and 48.11 Mm^3 as domestic and industrial draft. A maximum abstraction of 201.60 Mm^3 has taken place in Sayla block and minimum 39.38 Mm^3 abstraction has occurred in Ahore block. Among aquifer units maximum abstraction of 130.61 Mm^3 are obtained from older alluvium unit in Sanchore block of Jalore district.

A total of 259.04 Mm^3 are abstracted from Jodhpur district part of the ACZ which include 239.53 Mm^3 as agriculture draft and the 19.51 Mm^3 as domestic and industrial draft. The maximum and minimum abstraction of 145.16 Mm^3 and 113.89 Mm^3 in Bhopalgarh and Bilara block respectively have taken place in the district. Among aquifer units maximum abstraction of 102.18 Mm^3 are obtained from Vindhyan sandstone unit in Bhopalgarh block of the district.

In Pali district part of the ACZ total 347.43 Mm^3 of ground water is abstracted which include 304.89 Mm^3 as agriculture draft and 42.54 Mm^3 as domestic and industrial

draft. A maximum abstraction has taken place in Jaitaran block which amount to 72.95 Mm^3 and minimum 5.56 Mm^3 abstraction has occurred in Rohat block. Among aquifer unit maximum abstraction of 46.80 Mm^3 are obtained from older alluvium unit in Jaitaran block of the district.

A total of 238.26 Mm^3 are abstracted from Sirohi district part of the ACZ which include 222.63 Mm^3 as agriculture draft and 15.63 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Reodar block which amount to 93.47 Mm^3 and minimum 70.65 Mm^3 abstraction have occurred in Sheoganj block. Among aquifer units maximum abstraction of 55.55 Mm^3 obtained from Younger alluvium unit in Sheoganj block the district.

1.15 Static Groundwater Resources

1.15.1 Static Ground Water Resource (Fresh Ground Water)

The fresh static ground water resources of ACZ II (b) for year 2010 are given in Table 1.15-1.

Source: - CGWB and RGWD

The total assessed fresh static ground water resource of the ACZ is 4,454.32 Mm^3 and range from 30.44 Mm^3 in Sirohi district to maximum 3,402.80 Mm^3 occurring in Jalore district. Among blocks, the Bhinmal block of Jalore district constitute maximum static ground water resource of 955.36 Mm^3 in the ACZ.

1.15.2 Static Ground Water Resources (Saline Ground Water)

The saline static ground water resources of ACZ II (b) for year 2010 are given in Table 1.15-2.

ACZ IIb Total			**1,041.51**	**1,788.69**	**171.74**	**Over Exploited**

Note: - Zero availability means negligible value

It may be seen from the table that net ground water availability in the ACZ is assessed as 1,041.51 Mm^3 and draft for all types of uses as 1,788.69 Mm^3. This works out the stage of ground water development in ACZ as 171.74 % giving the zone an Over Exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ II(b) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ II(b)-010.

Of the total 24 blocks of ACZ, 21 blocks in various districts covering the ACZ are categorised as ground water over-exploited blocks with stage of ground water development to range from 112.39 (Rani block, District Pali) to 377.67% (Sayla block, district Jalore). Of the remaining blocks 2 are categorised as critical and 1 as semi-critical.

1.16.2 Dynamic Ground Water Resource (Saline Ground Water)

The assessed net availability of saline dynamic ground water resource for the ACZ for year 2010 is shown in Table 1.16-2.

ACZ IIb Total			**226.76**

Note: - Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 226.76 Mm^3. The net ground water availability in Barmer district part of the ACZ is 25.04 Mm^3 while that of Jalore district is 50.16 Mm^3, The net ground water availability in Jodhpur district is 4.58 Mm^3 while that of Pali district is 146.99 Mm^3. The maximum net ground water availability is in Ahore block of Jalore district amounting to 36.56 Mm^3.

1.17 Assessment of Groundwater Availability

The net dynamic ground water availability at year 2010 in ACZ II (b) is 1,041.51 Mm^3 and ground water draft 1,788.69 Mm^3. The stage of ground water development in zone is 171.74% and is categorised as over- exploited zone. Saline ground water resource of the zone is assessed at 226.76 Mm^3.

The total static ground water resource in ACZ assessed at 5,061.29 Mm^3, out of which 606.97 Mm^3 is saline ground water.

1. Groundwater Study of Agroclimatic Zone III (a)

1.1 General

The ACZ covers an area of 29512.93 km^2 and includes the district of Jaipur, Ajmer, Dausa and Tonk. The average annual rainfall in zone is 518.7 mm and mean annual evaporation 218.3 mm.

1.2 Geology

About half of the area of the ACZ III (a) comprises Quaternary alluvium and remaining half as Pre-Cambrian group of rocks mainly of Quartzite, Phyllite, Schist, Gneiss and Marble rocks.

1.3 Hydrogeology

The Hydrogeology of hydro-strategraphic units as aquifers occurring in ACZ is described in following paragraph. Area occupied by various aquifer units in different blocks and districts of covering ACZ is given in Table 1.4-1. Hydrogeology map of ACZ I (a) is at Drawing No. ACZ III(a)-001.

Alluvium

This formation comprised of Younger and Older alluvium. The younger alluvium mainly consists of fluvial deposits of sand, gravel, pebbles and cobbles, with small amounts of silt and clay. The Older alluvium is a heterogeneous mixture of varying sizes of sand, silt, clay and kankar. It covers a large area in Bandikui block of Dausa district and major parts of Jaipur district. In Tonk district the Younger alluvium occurs mainly along river channels and other streamlets. The alluvium found along river channels is generally of high potential whereas elsewhere it is considered less productive. The thickness of the alluvium ranges from less than 20 to more than 100 m. The yield of wells tapping alluvium ranges from 1.16 lps to 5.79 lps. In Amba Bari (Jaipur), a tube-well drilled for water supply yielded about 8.64 lps with a drawdown of 7.85 m. In Nagariya valley-fills area of Tonk District, many tube-wells have been drilled for drinking water supply. The discharge of tube-wells range from 3.01 lps to 6.94 lps with drawdown of 0.6 m to 2.15 m.

In Ajmer district, only few exploratory wells have been drilled. In Pushkar valley, the yield of tube-wells tapping alluvium aquifer ranges from 1.27 to 1.54 lps. Transmissivity in Pushkar well, estimated by a pumping test, is around 41 m^2/day. In Dausa district many wells have been constructed under the exploration program of CGWB in the alluvium formation. The discharge of these wells range from less than 0.16 lps to more than 4.71 lps. The value of transmissivity at Guda Ka Tala EW is around 7 m^2/day, while it is as high as 1,688 m^2/day in Sikrai EW. Groundwater in these areas occurs under semi-confined to confined conditions as indicated by the values of storativity ranging from 1×10^{-3} to 6.7×10^{-5}. In Jaipur District, several tube-wells have been drilled under exploration program and drinking water supply schemes in alluvium as well as in hardrock formations. The yield of tube-wells in the alluvium formations range from less than 0.16 lps to 8.68 lps in Amba Bari (Jaipur). The value of transmissivity in the alluvium ranges from 23 m^2/day at Harmara to 3,144 m^2/day in

Bhabru. The storativity values ranging from 1.05×10^{-3} to 4.7×10^{-5} indicate that the groundwater occurs under confined conditions.

Quartzite

The quartzite is inter-bedded with phyllites. It has a wide occurrence in (a) Jawaja, Pisangan, Silora and Srinagar Blocks of Ajmer District (b) parts of Dausa and Bandikui Blocks of Dausa Districts (c) Bairath, Bassi, Jamwa Ramgarh and Kotputli Blocks of Jaipur District. The rocks are jointed, fractured and foliated and have low groundwater potential. Well yields range from 1.16 to 1.97 lps.

Phyllite and Schist

Phyllite and schist belonging to Bhilwara Super Group are prevalent in the area around all the blocks of Tonk district and Dudu, Jamwa Ramgarh and Phagi blocks of Jaipur district. The rocks are jointed, fractured and foliated. These formations are of low groundwater potential. Well yield range from 0.46 to 0.93 lps.

Gneisses (B.G.C.) and Gneisses

This hydrogeological unit includes granite and gneisses. It covers large areas around (a) Masuda, Bhinai, Silora, Srinagar, Arain and Kekri blocks of Ajmer District, (b) Bandikui Block in Dausa District (c) Dudu and Phagi blocks in Jaipur District (d) Malpura Block of Tonk District. It is hard, compact, fractured and jointed at shallow depths, and becomes massive with depth. The static water level (bgl) in the unit range from 3.70 m to 39.04 m. Well yields range from 0.35 to 9.5 lps for a drawdown of 8.33 m to 20.95 m.

1.4 Main Aquifers units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Table 1.4-1 Main Aquifer Units of ACZ III (a)

District	Block	Aquifer Units	Area (Km^2)

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 6 of Annex 2(b).

From Table no.1.5-1 it may be observed that explored aquifer depth of older alluvium aquifer unit of ACZ III a ranges from 18.50m (Choru, Uniara block, Tonk district) to 225m (Sanganer, Sanganer block, district. Jaipur); the SWL (bgl) from 2.32m (Saidabad, Uniara block, district Tonk) to 91.40m (Ratkuria, block Sanganer district Jaipur); and well discharge from 0.06 lps (Bhandawas, block Kekri district Ajmer) to 25 lps (Nimola, block and district Tonk).

The aquifer depth for younger alluvium of the ACZ ranges from 19.90m (Rudal Village, Amber block, district Jaipur) to 203.70m (Village Bhandarej, block and district Dausa) the SWL (bgl) from 0.59m (Village Bhabhru, block Viratnagar, district Jaipur) to 55.66m (Village Nayla, block Jamwa Ramgarh, district Jaipur) and well discharge from 0.17 lps (Village Surpura, block Shahpura district Jaipur) to 31.32 lps (Ambabari, block Jhotwara district Jaipur).

In hard rock aquifer unit of the ACZ the explored aquifer depth have a range from 13.20m (Kadera Village, block Kekri, district Ajmer) to 202.80m (Village Sainthal, block and district Dausa); the SWL (bgl) from 2.00m (Village and block Jawaja, district Ajmer) to 52.44m (Renwal Village, block Kotputali, district Jaipur) and well discharge from 0.06 lps (Village Bithur block Peesangan, district Ajmer) to 20 lps (Village Andhi, block Jamwa Ramgarh, district Jaipur).

1.6 Sub-surface Geology

Hydrogeological cross – section A-A' (Itawa – Anwa)

The cross–section A-A' (Figure 1.6-1 and Figure 1.6-2) has been drawn from Itawa Bhopji village in the northern part to Anwa village in southern part of the agroclimatic zone. The cross – section cuts across almost central part of the Agroclimatic Zone. Total length of the cross–section is 201.5 kms. The ground level elevation ranges from RL 280 meters (Barwas) to RL 492 meters (Itawa Bhopji) above mean sea level. The cross-section reveals that the thickness of Older alluvium of Quaternary age in southern part is almost nil. The thickness of alluvium in northern side ranges from 60 to 70 meters below ground level (Itawa Bhopji, Niwaroo). The Alluvium comprises find to medium grained sand along with clay and kankar. The cross–section depicts that alluvium is underlain by phyllite and Schist bed-rock aquifer of Delhi Super Group throughout the cross–sectional area.

The ground water levels in the area ranges from 8 meters below ground level (Barwas) to 64 meters below ground level (Itawa Bhopji).

Hydrogeological cross – section B-B' (Booj-Kekri)

The cross–section B-B' (Figure 1.6-3) has been drawn from Booj village in north–eastern part of the ACZ to south–south western part of the Agroclimatic Zone. Total length of the cross–section is 177 kms. The ground level elevation ranges from RL 312 meters (Bambore) to RL 391 meters (Booj) above mean sea level. It reveals from the cross–section that older alluvium of Quaternary age comprising fine to medium grained sand is having thickness of 4 meters (Booj) to 27 meters (Awika nagar) below ground level. In Central part of the cross–sectional area, alluvium is comprised of well sorted sediments (around Bambore and Awika nagar) having more thickness as compared to the other part of the cross- sectional area. Alluvium is underlain by Quartzite, Phyllite /Schists and Gneiss bed-rock aquifer of Delhi Super Group.

The ground water levels in the area ranges from 17 meters below ground level (Bambore) to 27 meters below ground level (Awika nagar).

Hydrogeological cross – section C-C' (Sarund – Garudwasi)

The cross–section C-C' (Figure 1.6-4) has been drawn from Sarund village in north – western part of the ACZ to Garudwasi village in south–eastern part of the Agroclimatic zone. Total length of the cross – section is 119 kms. The ground elevation ranges from RL 304 meters (Garudwasi) to RL 416 meters (Sarund) above mean sea level. The cross – section reveals that thickness of Older alluvium of Quaternary age ranges from 6 meters (Garudwasi) to 54 meters (Bamanwas) below ground level. The alluvium comprises fine sand, clay and kankar along with gravel at places. In major part of the cross–sectional area, alluvium is underlain by Quartzite of Delhi Super Group. In southern part of the cross–sectional area alluvium, however, is underlain by Phyllite and Schist bed-rock aquifer units of Delhi Super Group.

Ground water levels in the area ranges from 15 meters below ground level (Bamanwas) to 27.50 meters below ground level (Booj).

1.7 Depth to Groundwater

The pre-monsoon (2010) depth to ground water levels map of ACZ is at Drawing No. ACZ III(a)-003. Nearly half of the area of ACZ in its southwestern part have depth to ground water levels in the range for 5 to 20m (bgl) and remaining nearly half in north-eastern part have relatively deep ground water levels in the range of from 20 to 60m (bgl). The post-monsoon map 2010 (Drawing No. ACZ III(a)-004) revels by comparison changes in levels in south-eastern part of ACZ where locally ground water levels have risen as can be seen by the occurrence of shallow depth to water zones of less than 2m and 2 to 5m (bgl), which practically did not exist in pre-monsoon of 2010 in this ACZ.

1.8 Ground water Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ III (a) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-wise/Aquifer-wise fluctuation in levels of ground water-ACZ III (a)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)

ACZ IIIa Summary			**472**	**-6.10**	**10.70**	**3.64**

Source: CGWB and RGWD

It can be seen from the table that average ground water level fluctuation in Older alluvium ranges from-0.44 m in Lalsot block of Dausa district to 6.05 m in Uniara block of Tonk district. The average ground water level fluctuation in Younger alluvium ranges from-0.32 m in Amber block of Jaipur district to 2.20 m in Jamwa Ramgarh block of Jaipur district.

The above table also depicts that average ground water level fluctuation in hard-rock aquifers ranges from -3.48m (Quartzite) in Bassi block of Jaipur district to 9.20 m *Gneisses (B.G.C.) in Uniara block of Tonk district.

1.9 Ground water Levels and Flow Directions

This ACZ constitutes portions of a few river basins. The most expansive part is the northern Banas River Basin, whereas much smaller areas of other basins are included as well; two small patches of the Chambal River Basin in the south, a small portion of the Luni River Basin in the south west, some area of the Sabi River Basin in the north, a big portion of the Shekhawati River Basin in the north west and quite a big area of the Banganga River Basin in the north east.

Static water level contours (Map ACZ IIIa-002) in the major part of the ACZ area, which is the northern part of the Banas River Basin, converge towards and along the Banas River display a very moderate gradient, about 1-1.5m per 1km. Groundwater there is flowing eastwards, in the Banganga and Sabi parts it is flowing north eastwards, in the Shekhawati area the north eastwards and south westwards components of the flow into the Sambhar lake can easily be seen, as well as the westwards flow in the tiny portion of the Luni River Basin, in the west.

The operative aquifers in this ACZ are the Older and Younger Alluvium, Phyllite & Schist, Quartzite, Gneiss and Gneisses (B.G.C.) units. Except the alluvial formations, the other rock units cannot be considered as aquifers, in the full sense of the term but nevertheless, as is clearly demonstrated in the map, the contour level differences in the Gneisses (B.G.C.) and the Phyllite & Schist country rocks are not unlike the water level outline in the alluvial formations, and the developed hydraulic gradient there is even more moderate than in the alluvial aquifers of the neighbouring Sabi and Banganga portions within the present ACZ (Map ACZ IIIa-001). It seems that the colluviums and weathered mantle over these formations which are otherwise non auriferous, developed during long periods of exposure to erosion and weathering agents, can be considered as the real operative aquifers.

Such as is the case with the southern part of the Banas River Basin (see ACZ IVa) in the south, depth to water level in almost all the area does not exceed 20 – 30 m bgl, and the dominant water level is at a depth of 10 – 20 m bgl, with less than 10 m bgl in an upstream Banas tributaries area in the block of Arain (Map ACZ IIIa-003). This water level contour pattern and groundwater surface depth, similarly to ACZ IV(a) in the south, may also serve to explain the origin and mechanism of base flow, which is known to take place in similar hydrogeological environment. The deepest reported water level is in Jhotwara block in the north, naturally in an alluvial aquifer. In the neighbouring formations of the Gneisses (B.G.C.), Quartzite or the Phyllite & Schist this water level depth is not considered to be a possible scenario. Similar water level depth can be encountered in the neighbouring part of the Banganga River Basin, in the alluvial formations.

All the above listed points may easily serve to describe this area as having rather poor recharge characteristics and, likewise, not very impressive static groundwater reserves. Most of the precipitation seems to recharge the surface water system and not necessarily the groundwater resources. On the other side of the Aravallies almost all the precipitation, although much lower than in the east, seems to recharge the groundwater and there was therefore no natural reason for a surface network of drainage channels, such as in western Rajasthan, to be developed.

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ III(a) are shown in Figure 1.10-1 to 1.10-31. The supportive data for the same is given in Annex 9.

1.10.1 Tonk District

The pre-monsoon average groundwater levels in Tonk district in the year 1984 vary between a minimum of 265.81 m amsl (Uniara block) and maximum of 326.97 m amsl (Malpura block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 259.42 m amsl (Uniara block) and a maximum of 320.50 m amsl (Malpura block). Long-term ground water levels in each block are presented in Figures 1.10-1 - 1.10-6. The level change rates are given in Table 1.10-1.

The rate of decline of groundwater level during pre-monsoon period ranges between -0.07 m/year in Deoli Block and -0.26 m/year in Niwai Block (Pre-Monsoon 1984-2010; Table 1.10-1) whereas during post-monsoon period it ranges between -0.04 m/year in Deoli Block and -0.21 m/year in Tonk and Uniara Blocks.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Uniara block where average groundwater levels are predicted to reach 245.89 m amsl by the year 2060, ~12 m below current stages. As a result, 92% of the monitoring wells in the block will dry up (CGWB & RGWD).

1.10.2 Jaipur District

The pre-monsoon average groundwater levels in Jaipur district in the year 1984 vary between a minimum of 288.56 m amsl (Shahpura block) and maximum of 454.67 m amsl (Govindgarh block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 271.67 m amsl (Shahpura block) and a maximum of 433.42 m amsl (Govindgarh block). Long-term groundwater levels in each block are presented in Figures 1.10-7 - 1.10-19. The level change rates are given in Table 1.10-1.

In Jaipur District, the rate of decline in levels of groundwater ranges between -0.25 m/year in Jamwa Ramgarh Block and -1.18 m/year in Jhotwara Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB &

RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Sanganer, Jhotwara, Dudu and Amber Blocks where average groundwater levels are predicted to reach 284.92, 322.62, 331.96 and 354.73 m amsl (respectively) by the year 2060, 16-58 m below current stages. As a result, 100% of the monitoring wells (CGWB & RGWD) in these blocks will dry up.

1.10.3 Dausa District

The pre-monsoon average groundwater levels in Dausa District vary between a minimum of 271.14 m amsl in Bandikui Block and a maximum of 311.37 m amsl in Dausa Block (Pre-Monsoon 1984-2010; Table 1.10-1). Long-term groundwater levels in each block are presented in figures 1.10-20 - 1.10-22. The level change rates are given in Table 1.10-1.

In various blocks of the district, the rate decline in pre-monsoon ranges from -0.38 m/year in Dausa Block to -0.84 m/year in Lalsot Block whereas is ranges between -0.37 m/yr in Dausa Block and -0.90 m/yr in Lalsot Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Bandikui block where average groundwater levels are predicted to reach 208.74 m amsl by the year 2060, 40 m below current stages. As a result, 100% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.4 Ajmer District

The pre-monsoon average groundwater levels in Ajmer district in the year 1984 vary between a minimum of 329.27 m amsl (Kekri block) and maximum of 467.01 m amsl (Jawaja block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 327.03 m amsl (Kekri block) and a maximum of 465.51 m amsl (Jawaja block). Long term ground water levels in each block are presented in figures 1.10-23 to 1.10-30. The level change rates are given in Table 1.10-1.

The pre-monsoon rates of change of groundwater levels in district ranges between -0.08 m/year in Kekri and Jawaja Blocks and -0.42 m/yr in Kishangarh Block, whereas it ranges during post-monsoon period between +0.01 m/yr in Jawaja Block and -0.36 m/year in Peesangan Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Kishangarh Block where average groundwater levels are predicted to reach 368.74 m amsl by the year 2060, 20 m below current stages. As a result, 93% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.11 Long-term drafts

Figure 1.11-1 presents the long term draft for available years (1995, 2001, 2004, 2007 and 2009). Total draft in ACZ IIIa show a normal trend of steady increase in groundwater abstractions during the last 15 years. Total draft increased from 1,699 Mm^3 in 1995 to 2,585 Mm^3 in 2009, a total increase of 886 Mm^3 (Tables 1.11-1 - 1.11-5). The relative increase for the entire period was 52% with an average annual rate of +66 Mm^3/yr. The main increase is recorded Jaipur (60%) and Ajmer (56%) districts, although significant increase in draft was recorded also in the other 2 districts (Tonk, 39% and Dausa, 38%). Figure 1.11-2 presents the long term draft according to the type of usage. The graph displays that increase took place both in agriculture and domestic-industry sectors. Although the relative increase of domestic-industry sector is considerably higher (139% compared to 43%), the significance of the domestic consumption is minor. Groundwater draft for agriculture increased between 1995 and 2009 from 1,533 to 2,190 Mm^3 while domestic and industrial usages rose from 165 to 395 Mm^3 (Figure 1.11-2). The 'draft per area' ratio varies considerably throughout the ACZ. In the northeast around Jaipur and Dausa Districts, the draft volumes are among the highest in the state and reach values of above 0.2 Mm^3/Km^2 while in the south-western part, around Ajmer District the draft volumes are usually below 0.05 Mm^3/Km^2 (Figure 8.8).

1.11.1 Ajmer District

Groundwater draft in this district reached almost 429 Mm^3 during 2009 which comprise ~17% of the total draft in the ACZ (Figure 1.11-1). Between the years 1995 and 2009 draft values increased from 274 Mm^3 to 429 Mm^3, a relative increase of 56% (Table 1.11-1, Figure 1.11-3). The increase was in agriculture consumption and in domestic-industrial consumption at approximately the same rate (62% and 57% corresponding). However, the domestic & industrial drafts comprise a small fraction (11%) of the total draft (2009) (Figure 1.11-2, Table 1.11-5). The main abstractions in this district are taking place in Peesangan and Kekri blocks, 109 and 74 Mm^3 corresponding (2009; Figure 1.11-13). Minimum exploitation was recorded in Jawaja block, 28 Mm^3 in 2009. Increase in drafts for the entire period range between a maximum of 99% in Peesangan block and a minimum of 0.09% in Jawaja Block (Table 1.11-1). The 'draft per area' ratio is relatively moderate compared to the rest of the state. Values stand on 0.04 Mm^3/Km^2 in all the blocks excluding Peesangan and Kekri which reach both ~0.08 Mm^3/Km^2 (Figure 8.8).

Table 1.11-1 Total Change in Groundwater Draft in Ajmer District - 1995 to 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Arain	51%	62%	52%
Binay	27%	29%	27%
Jawaja	-5%	68%	0%
Kekri	73%	37%	70%
Masooda	29%	33%	30%
Peesangan	100%	87%	99%
Kishangarh	93%	-2%	77%
Shrinagar	26%	139%	41%
District Summary	**56%**	**62%**	**63%**

1.11.2 Dausa District

The groundwater draft in this district during 2009 stands on 339 Mm^3 and comprises ~13% of the total draft in the ACZ. Between 1995 and 2009 a significant increase in groundwater exploitation took place from 244 Mm^3 to 339 Mm^3, a growth of 39% in fifteen years (Figure 1.11-4, Table 1.11-2). Similar pattern was recorded in all the blocks in the district. Dramatic increase of >350% was recorded in the domestic and industrial sectors in the blocks of Dausa and Sikrai (Table 1.11-2). However, since the domestic-industrial component is only ~8% (2009) from the total draft its impact on the overall growth rate is relatively low (Table 1.11-5). The 'draft per area' ratio is relatively high throughout the district and reaches ~0.07 Mm^3/Km^2 (Figure 8.8).

Table 1.11-2 Total Change in Groundwater Draft in Dausa District 1995- 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bandikui	30%	-27%	24%
Dausa	49%	381%	64%
Lalsot	33%	57%	33%
Sikrai	33%	369%	40%
District Summary	**36%**	**101%**	**39%**

1.11.3 Jaipur District

The groundwater draft in this district comprises ~53% of the total draft in the ACZ (Figure 1.11-1). During the examined period an increase of 60% was recorded from 877 Mm^3 in 1995 to 1,400 Mm^3 in 2009 (Figure 1.11-5). Consumption of domestic and industrial sectors usually does not exceed more than 10% of total consumption except for Jhotwara Block which reached 56% (Table 1.11-5). Increase in the domestic and industrial sector exceeded 100% in all blocks and reached a maximum of >500% in some of the blocks (Amber, Viratnagar, Bassi, Chaksu and Dudu, see Table 1.11-3). Significant draft is taking place in all blocks, however the abstractions in the blocks of Sambhar, Jhotwara and Amber are exceptionally high and towards 2009 reach above 150 Mm^3 each (Figure 1.11-5, Table 1.11-5). The lowest consumption is found at Phagi (<50 Mm^3, 2009). 'Draft per area' ratio is high all over the district especially in Jhotwara Block where it reached values of >0.2 Mm^3/Km^2 (Figure 8.8).

1.11.4 Tonk District

Groundwater drafts in this district comprise ~16% of the total draft in the ACZ Table 1.11-5, Figure 1.11-1). Between 1995-2009 total draft in the district increased from 304 Mm^3 to 418 Mm^3 (Figure 1.11-6), an overall relative increase of 38% (Table 1.11-4). Most of the increase occurred between 2001 and 2004 and is reflected in all blocks (Table 1.11-5, Figure 1.11-6). The average consumption (1995-2009) of the domestic and industrial sector is about 17% of the total consumption in the district (Table 1.11-5). In all blocks an increase of >50% was recorded in the domestic-industrial sector. In the blocks of Malpura and

Todaraisingh increase in the domestic-industrial sector exceeded 100%. The agricultural sector recorded also a significant increase, reaching >50% in the blocks of Deoli and Todaraisingh and exceeded 100% in Uniara block (Table 1.11-4). 'Draft per area 'ratio is relatively high mainly in the eastern part of the district in the Blocks Uniara, Tonk and Niwai and reach values of ~0.07 Mm^3/Km^2 (Figure 8.8).

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 5272 villages in ACZ III(a), 2671 are found suitable for drinking water use, 3675 for irrigation use and 4929 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in ground water is summarised in Table 1.12-1.

Table 1.12-1 Village and block wise water quality

ACZ	District	Block	Total Number of Villages	Electrical Conductivity, µS/cm			Chloride, mg/l			Fluoride, mg/l			Nitrate, mg/l

Source: CGWB and RGWD

It may be seen from above that out of 5272 villages of ACZ IIIa, 2849 fall under desirable, 2028 under maximum permissible limit and 395 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 2125 while number of villages with maximum permissible limit of use is 876 and number of above maximum permissible limit for Fluoride is 2271. As regards presence of nitrate in ground water, 3340 fall under highest desirable limit of less than 45 mg/l and 1316 under maximum permissible limit along with 616 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 3018 villages fall under maximum permissible limit and 1598 under above maximum permissible limit of 2250 microhos/cm and 656 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

i) Ground Water Quality of ACZ III (a) by chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ III(a) is shown in Drawing No. ACZ III(a)-005. Nearly half of the area of ACZ is having fresh ground water. Fresh ground water with less than 250 mg/l of chloride concentration occurs in northern and eastern part of ACZ in Jaipur and Dausa districts and in southern part of Tonk district. The central and western part of ACZ have chloride level of 250-1000 mg/l and beyond 1000 mg/l concentrations.

Block-wise / aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in the Table 1.12-2.

Table 1.12-2 Percent area occupied with various level of Chloride in ground water of ACZ III (a)

ACZ IIIa Summary			**46.29**	**41.58**	**12.13**

Source: CGWB and RGWD

It may be seen from above that 46.29% area of the ACZ bear potable ground water with chloride level of <250 mg/l.

The table depicts that 100% area occupied by Older alluvium aquifer unit in Shrinagar block, Older alluvium and Quartzite aquifer units in Kishangarh block of Ajmer district; Quartzite aquifer units in Jhotwara and Phagi blocks, Phyllite/Schist aquifer unit in Sambhar block of Jaipur district and older alluvium aquifer unit in Malpura block of Tonk district; bear concentration of Chloride in the range of 250 to 1000 mg/l or beyond.

ii) Ground Water Quality of ACZ III (a) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ III(a) is shown in Drawing No. ACZ III (a)-006. It can be seen from the map that excepting localized pockets of high nitrate level ground water of >100 mg/l concentration, the most part of the area, occupied with alluvium, limestone and gneiss rock units bear drinking quality ground water with NO_3 content of less than 45 mg/l.

Block-wise / aquifer-wise percent area occupied with various levels of Nitrate salinity in groundwater of ACZ is shown in Table 1.12-3.

Table 1.12-3 Percent area occupied with various level of Nitrate in ground water of ACZ III(b)

ACZ IIIa Summary			**59.15**	**27.68**	**13.17**

Source: CGWB and RGWD

From the above table it can be seen that 41.73% area of Ajmer district, 69.36% of Dausa district, 64.59% area of Jaipur district and 66.55% area of Tonk district of ACZ are covered with potable quality ground water. Phyllite/Schist in Sambhar block of Jaipur district and Older alluvium aquifer in Sikrai block of Dausa district area covered with poor quality ground water with NO_3 content more than 100 mg/l or between 45 mg/l and 100 mg/l.

iii) Ground Water Quality of ACZ III (a) by fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ III(a) is shown in Drawing No. ACZ III(a)-007.

From map, it may be observed that potable quality ground water with fluoride level of <1.5 mg/l occurs in Alluvium, Quartzite, Phyllite/Schist aquifer units in northern part of ACZ in parts of the district of Dausa and Jaipur and in southern part of the ACZ in part of the districts of Tonk and Ajmer occupied with Gneisses (B.G.C.), Phyllite/schist and alluvium aquifer units. A large part of ACZ in its central and western part is occupied with non-potable ground water with fluoride concentration exceeding 1.5 mg/l

Block-wise / aquifer-wise percent area occupied with various levels of Fluoride salinity in groundwater of ACZ is shown in Table 1.12-4.

Table 1.12-4 Percent area occupied with various level of Fluoride in ground water of ACZ III (a)

ACZ IIIa Summary			**32.48**	**17.37**	**50.15**

Source: CGWB and RGWD

As may be seen from above, about 50% area of the ACZ bear non-potable ground with fluoride level of >1.5 mg/l. The 100% fluoride-rich ground water belongs to Gneisses (B.G.C.) aquifer unit in Bhinay block, Quartzite and Gneisses (B.G.C.) aquifer unit in Peesangan block and Gneisses aquifer unit in Srinagar block of Ajmer district; Phyllite/Schist aquifer unit in Sambhar block of Jaipur district and Older alluvium aquifer unit in Malpura block of Tonk district with fluoride level beyond 1.5 mg/l.

iv) Ground Water Quality of ACZ III (a) by EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ III(a) is shown in Drawing No. ACZ III(a)-008. From map it can be seen that Western part of ACZ in Ajmer district occupied by Older alluvium, Gneisses (B.G.C.) and phyllite/schist unit bear high salinity ground water including isolated pockets in Jaipur district occupied by Quartzite and Phyllite/Schist units. The remaining area of ACZ bear low to moderate salinity ground water with EC range of <750 to 2250 micromhos/cm.

Block-wise / aquifer-wise percent area occupied with various levels of EC salinity in groundwater of ACZ is shown in Table 1.12-5.

Table 1.12-5 Percent area occupied with various level of EC in ground water of ACZ III (a)

Source: CGWB and RGWD

From the table it can be observed that 100% area occupied with older alluvium aquifer unit in Shahpura and Govindgarh blocks, Quartzite aquifer unit in Jhotwara block of Jaipur district; Gneisses (B.G.C.) aquifer unit in Tonk block, Shale aquifer unit in Uniara block of Tonk district comprise ground water salinity between less than750 micromhos/cm to 2250 micromhos/cm. It is also depicted from the table that in general 62.58% area of the ACZ bear good quality of water with EC value ranging from less than 750 micromhos/cm to 2250 micromhos/cm while 37.42 % area bear poor quality of water with EC value ranging from 2250 micromhos/cm to more than 5000 micromhos/cm.

1.12.3 Long term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ III(a) are shown in Figure 1.12-1 to 1.12-62. The supportive data for the same is given in Annex 10.

Ajmer District

Average chloride and EC concentrations per block for the period 1990-2009 are displayed in Figures 1.12-1 to 1.12-15 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary between a minimum of <400 mg/l in Jawaja and Binay blocks at the southern parts of the district to a maximum of above 1,200 mg/l (permissible limit for drinking is 1,000 mg/l) in Arain and Shrinagar blocks at the middle part of the district. High values of 1,000 mg/l are recorded also at Kekri block at the south-eastern edge of the district. Long term trend vary between moderate increase of ~2 mg/l/y in Binay block to significant decrease of above 15 mg/l/y at Shrinagar block. From spatial perspective one can see that especially high chloride concentrations extend along a strip that crosses the district from northwest to southeast. The initial assumption is that there is a connection between the high concentrations to salts drain toward the river channel that pass the district (Dain River). However, the correlation between the factors is not complete and may well be other factors that we are non-aware of them responsible for this pattern. Moreover, general view indicates that high chloride concentrations in this district are high comparison with other districts in the ACZ. Probably because the groundwater in this area shallow and usually not deep beyond 10m bgl.

EC trends follow the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly between 2,000 and 6,000 µS/cm (permissible limit for drinking is 2,250 µS/cm) and various along the blocks is low. Minimum concentrations were recorded in Kishangarh block (2,000 to 5,000 µS/cm) while maximum (average) concentrations are observed in Arain block (4,000 to above 5,000 µS/cm) Long term trend behave at most of the time similarly to the chloride and so the spatial distribution.

Average NO_3 and F levels per block for the period 1984-2009 are display in Figures 1.12-2 to 1.12-16 (even figures). Average NO_3 concentrations in most blocks are between 50 and 150 mg/l; around the permissible limit for drinking (100 mg/l). Minimum values of ~45 mg/l recorded at Kekri block, Maximum values of above 200 mg/l took place at Masooda block. Long term trend is stable along all the period in most blocks.

Fluoride (F) concentrations are presented in Figures 1.12-2 to 1.12-16, beside with the nitrates. Spatial view shows that in the middle and eastern parts of the district F concentration is little bit higher and reaches maximum values of 3-4 mg/l at Arain and Kekri blocks, while usually concentration range between 1 to 3 mg/l. Long term trends presenting moderate decline trends of ~0.07 mg/l/y or less in all the blocks except for Arain block that show negligible increase of ~0.01 mg/l/y.

Tonk District

Average chloride and EC concentrations per block for the period 1984-2009 are displayed in Figures 1.12-17 to 1.12-27 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations differ between a minimum of below 200 mg/l in Uniara, Niwai and Deoli blocks at the eastern and southern parts of the district to maximum of beyond 1,000 mg/l (permissible limit for drinking is 1,000 mg/l) in Malpura block at the western side of the district. Long term trend various between increases of above 5 mg/l/y in Todaraisingh and Tonk blocks to decrease of almost 12 mg/l/yr at Deoli and Niwai blocks. Overview shows that chloride concentration in this district, especially in the West, relatively low. This despite groundwater is shallow and exposed to pollution from overhead. We assume that there is a connection between large and medium agricultural projects in the eastern and central sides of the district like Bisalpur Dam and Galwa Bund to low concentrations and their spatial distribution characterizes. Possible that those projects, that established in the recent years, creating dilution of groundwater. In fact one can see in these areas that from the beginning of the new millennium groundwater level Stabilized and similarly Chloride concentrations are kept relatively stable and sometimes even recording decline.

EC trends follow the chloride trends noted above in most of the blocks, in spite of long term trends are more stable and spatial various is lower. Average EC values in the district are usually stable on 2,000 µS/cm (permissible limit for drinking is 2,250 µS/cm). This except for Malpura and Todaraisingh blocks at west side of the district where maximum values can reach 6,000 µS/cm.

Average NO_3 and F levels per block for the period 1984-2010 are presented in Figures 1.12-18 to 1.12-28 (even figures). Average NO_3 usually range between 50to300 mg/l; around and above the permissible limit for drinking (100 mg/l). Peak values were recorded in Malpura block and reach above300 mg/l (1990-1994). Long term trends are presenting in most of the blocks moderate to medium decline in rate of ~3-9 mg/l/y. Global view shows that nitrate concentration in this district is relatively high compared to the other districts in the ACZ. As we noted above ground water depth in this district is shallow and therefore the exposed to pollution form agriculture source is high.

Fluoride concentrations are presented in Figures 1.12-18 to 1.12-28, beside with the nitrates. In general, concentrations in this part of the ACZ fluctuate between 1-4 mg/l. In most of the time, F levels range around or slightly above the permissible limit for drinking (1.5 mg/l). Yet along to the northern side of the district in the blocks Malpura and Niwai recording peaks of 4-5 mg/l. Long term trends keeps stable or close to stability in all the blocks.

Jaipur District

Average chloride and EC concentrations per block for the period 1984-2009 are displayed in Figures 1.12-29 to 1.12-53 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary between a minimum of below 150 mg/l in Viratnagar and Shahpura blocks at the north-eastern and central parts of the district to maximum of above 1,200 mg/l (permissible limit for drinking is 1,000 mg/l) in Phagi, Chaksu and Dudu blocks at the south-western side of district. Long term trend varies widely between high increase of almost 18 mg/l/yr in Phagi to decrease of above 6 mg/l/y at Chaksu block. Although salinity trends are not totally clear it seems that when the chloride concentrations low as like as at Viratnagar and Jhotwara blocks stable trends took please, while when the concentrations are high sharp trends recording as we showed up. From spatial perspective one can see that at the north-eastern side of the district chloride concentration are lower. In parallel ground water level in this areas are deep and communally jet down below 50 m bgl. This is apparently the reason that the groundwater in this area is not exposed to pollution from overhead and keeps relatively fresh. Those despite the pumping is massive (draft per area ratio in this region is among the highest in the stat and stands on above 2 Mm^3/Km^2) and there is continuing violation of the aquifer as reflected in ground water sharp decline of above 1 m/y in some places.

EC trends follow the chloride trends noted above in most of the blocks, yet long term trends are more stable and spatial various is lower. Average EC levels in the district are regularly between 1,000 and 4,000 µS/cm (permissible limit for drinking is 2,250 µS/cm). Minimum values of below 1,000 µS/cm took place in all the east and north

blocks, while maximum values of above 4,000 µS/cm recorded at the west edge of the district in Phagi and Sambhar blocks.

Average NO_3 and F levels per block for the period 1984-2009 are display in Figures 1.12-30 to 1.12-54 (even figures). Average NO_3 concentrations in most blocks at most of the time are between 50 and 100 mg/l; below the permissible limit for drinking (100 mg/l). Yet, at the southern part of the district around the blocks; Chaksu, Dudu and Phagi concentrations are much higher and range between 100 to 200 mg/l with peak of above 300 mg/l. Long term trends varies widely along the district from moderate increase of ~3 mg/l/y in Jamwa Ramgarh block to significant decrease of ~6 mg/l/y in Chaksu block. Nonetheless in most of the blocks the dominant trend is moderate decline in average rate of ~2 mg/l/y.

Fluoride concentrations are presented in Figures 1.12-30 to 1.12-54, beside with the nitrates. Spatial view shows that at the southern parts of the blocks F concentration is high and reaches maximum values of 4-6 mg/l in Chaksu, Phagi and Dudu blocks. At the middle and northern parts of the district values usually moving between 1 to 3 mg/l. Reasons for the spatial distribution pattern of fluoride are not completely clear, but may mineral of fluoride flushing from the north-western parts of the Aravalis and accumulating along Banas tributes (Bandi and Dhuand rivers) at the downstream. Long term trends varied widely from decline of ~0.07 mg/l/y in Dudu and Kotputli blocks to increase in similar rate in Sambhar block.

Dausa District

Average chloride and EC concentrations per block for the period 1992-2009 are presented in Figures 1.12-55 to 1.12-61 (odd figures). The graphs demonstrate well the good correlation between the two parameters. Average concentration fluctuated between 100 mg/l to 600 mg/l. Maximum values recorded in Dausa and minimum concentrations recording in Amber block. Nevertheless the spatial variance between the blocks very low and there is no clear spatial distribution pattern between the blocks. Long term trend rang between stability in Amber and Lalsot blocks to moderate increase of 6-7 mg/l/y in Sikrai and Dausa blocks. At spatial sight it seems that this district behaves similarly to Jaipur district. One can see that in few points where shallow groundwater found, like at the center of Dausa block there is a significant increase in the concentrations of chlorides. Here, too, probably from exposure to overhead pollution.

EC trends follow the chloride trends mentioned above in all blocks. Average EC levels in the district are regularly between 1,000 and 4,000 µS/cm. In all the blocks except Dausa values range below or around the permissible limit for drinking (2,225 µS/cm), while in Dausa block concentrate is higher and reach 4,000 µS/cm. Long term trends are stable or presenting negligible increases along the entire district.

Average NO_3 and F levels per block for the period 1992-2009 are presented in Figures 1.12-56 to 1.12-62 (even figures). Average NO_3 varies widely from minimum of ~10 mg/l in Bandikui to maximum of above 400 mg/y in Dausa block. General view shows that nitrate concentrations are relatively low along all the district. Furthermore in the blocks Lalsot and Bandikui took place significant decrease trend of 5-6 mg/l/y. Yet in the middle part of the district around Dausa block recorded consistent and sharp rise,

from ~20 mg/l in 1994 to peck of above 400 mg/l in 2009, Average growth rate of ~12 mg/l/y. The pollution source in this area is not totally clear but it seems that the pollution spot south to Dausa city is part of larger stain that spreading also to nearby Jaipur district.

Fluoride concentrations are presented in Figures 1.12-56 to 1.12-62, beside with the nitrates. In general, concentrations in this part of the ACZ fluctuate between 1-3 mg/l. in all the blocks except for Shrinagar block, F levels are range around or below the permissible limit for drinking (1.5 mg/l). In Bandikui, Dausa and Sikrai blocks long term trend keeps stable while in Lalsot recorded significant decline of ~0.04 mg/l/y. \

		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_2	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_2S_1	High Salinity & Low Sodium
		C_2S_2	High Salinity & Medium Sodium
		C_2S_2	High Salinity & High Sodium
		C_2S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
9	Younger Alluvium	C_4S_2	Very High Salinity & Medium Sodium
		C_4S_2	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
10	Gneisses(B.G.C.)	C_2S_1	High Salinity & Low Sodium
		C_2S_2	High Salinity & Medium Sodium
		C_2S_2	High Salinity & High Sodium
		C_2S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_2	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium

It can be seen from above table that in ACZ III(a) high salinity and low sodium to very high salinity and high sodium class of water exist only in Gneisses (B.G.C.) aquifer unit.

High salinity and low sodium irrigation water classes pertain to limestone and shale aquifer units. Also high salinity and medium sodium to very high salinity and very high sodium range of classes of water exist only in Gneissic rock aquifer units.

In older alluvium, phyllite/schist and younger alluvium units of ACZ, irrigation water classes have range from medium salinity and low sodium to very high salinity and very high sodium. Bhander sandstone occupying a very a small area in extreme south-eastern part of the ACZ, has high salinity and low sodium class of irrigation water.

As can be seen from classes of irrigation water map of ACZ III(a) shown in Drawing No. ACZ III(a)-009, a large part of ACZ bear good to excellent irrigation water classes except western part of ACZ which bear bad irrigation water classes not suitable for irrigation or most soil and crop combination.

1.14 Groundwater Draft Village-wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ III(a). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Ground water Abstractions in ACZ III (a)

District	Block	Hydrogeological Unit	Gross Draft in Fresh Groundwater		
			Agricultural, Mm^3/yr	Domestic and Industrial, Mm^3/yr	All Uses, Mm^3/yr
AJMER	Arain	Gneisses(B.G.C.)	40.22	3.09	43.31

ACZ Total			2,256.56	411.71	2,668.27

Source: Village-wise data of Tehsil, CGWB and RGWD

It may be observed from the above table that total abstractions for all uses in ACZ IIIa is 2,668.27 Mm^3 which include 2,256.56 Mm^3 as agriculture draft and 411.71 Mm^3 as domestic and industrial draft.

A total of 429.81 Mm^3 are abstracted from Ajmer district part of the ACZ which include 380.18 Mm^3 as agriculture draft and 49.63 Mm^3 as domestic and industrial draft. Maximum abstraction of 112.43 Mm^3 is in Peesangan block.

In Dausa district part of the ACZ total 361.14 Mm^3 of ground water is abstracted which include 330.01 Mm^3 as agriculture draft and 31.13 Mm^3 as domestic and industrial draft. A maximum abstraction of 126.26 Mm^3 has taken place in Lalsot block and minimum 71.92 Mm^3 abstraction has occurred in Sikrai block. Among aquifer units maximum abstraction of 94.69 Mm^3 are obtained from older alluvium unit in Lalsot block of Dausa district.

A total of 1,458.88 Mm^3 are abstracted from Jaipur district part of the ACZ which include 1,164.37 Mm^3 as agriculture draft and the 294.51 Mm^3 as domestic and industrial draft. The maximum abstraction of 245.60 Mm^3 has taken place in Jhotwara block. Among aquifer units maximum abstraction of 173.18 Mm^3 are obtained from Younger alluvium unit in Jhotwara city block of the district.

A total of 418.45 Mm^3 are abstracted from Tonk district part of the ACZ which include 382 Mm^3 as agriculture draft and 36.45 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Niwai block which amount to 83.50 Mm^3 and minimum 38.62 Mm^3 abstraction have occurred in Todaraisingh block. Among aquifer units maximum abstraction of 66.26 Mm^3 obtained from Phyllite/Schist unit in Deoli block of the district.

1.15 Static Groundwater Resources

1.15.1 Static Ground Water Resource (Fresh Ground Water)

The fresh static ground water resources of ACZ III (a) for year 2010 are at Table 1.15-1.

Source: CGWB and RGWD
Note: Zero availability means negligible value

A total of 2,085.68 Mm^3 of static ground water resources have been assessed for ACZ IIIa, These have a range from 67.53 Mm^3 in Ajmer district to 1,486.14 Mm^3 in Jaipur district of the ACZ. Among blocks the static ground water resources range from 1.65 Mm^3 in Jawaja block of Ajmer district to 177.83 Mm^3 in Govindgarh block of Jaipur district.

1.15.2 Static Ground Water Resources (Saline Ground Water)

The saline static ground water resources of ACZ III (a) for year 2010 are given in Table 1.15-2.

District Total			**6.35**
ACZ IIIa Total			**53.05**

Source: - CGWB and RGWD
Note: - Zero availability means negligible value

In this ACZ the saline static ground water resources are assessed at 53.05 Mm^3 which range from 6.35 Mm^3 in Tonk district to 30.67 Mm^3 in Jaipur district of the ACZ.

1.16 Dynamic Ground water Resources

1.16.1 Dynamic Ground Water Resource (Fresh Ground Water)

The assessed net availability of dynamic ground water resource, ground water abstraction for all type of uses, the stage of ground water development and category of development block for ACZ for year 2010 is shown in Table 1.16-1.

Table 1.16-1 Fresh Dynamic Ground Water Resources (2010) of ACZ III (a)

District	Block	Hydrogeological Unit	Net Groundwater Availability, Mm^3	Gross Draft for All Uses, Mm^3	Stage of Groundwater Development, %	Category

ACZ IIIa Total			**1,591.61**	**2,668.27**	**167.65**	**Over Exploited**

Note: - Zero availability means negligible value

It may be seen from the table that net ground water availability in the ACZ is assessed as 1,591.61 Mm^3 and draft for all types of uses as 2,668.27 Mm^3. This works out the stage of ground water development in ACZ as 167.65% giving the zone a ground water over exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ III(a) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ III(a)-010.

Of the total 31 blocks of ACZ, 27 blocks in various districts covering the ACZ are categorised as ground water over-exploited blocks with stage of ground water development to range from 100.79 (Malpura block, district Tonk) to 492.78% (Jhotwara block, district Jaipur). Of the remaining blocks 2 are categorised as critical and 2 under semi-critical category.

1.16.2 Dynamic Ground Water Resource (Saline Ground Water)

The assessed net availability of saline dynamic ground water resource for the ACZ for year 2010 is shown in Table 1.16-2

Table 1.16-2 Saline Dynamic ground water resources of ACZ III (a)

	Block Total		**1.36**
District Total			**32.53**
ACZ IIIa Total			**80.45**

Note: - Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 80.45 Mm^3. The net ground water availability in Ajmer district part of the ACZ is 19.72 Mm^3 while that of Dausa district is 9.49 Mm^3. The net ground water availability in Jaipur district is 18.70 Mm^3 and that in Tonk district is 32.53 Mm^3. The maximum net ground water availability is in Tonk block of Tonk district and amounting to 17.81 Mm^3.

1.17 Assessment of Groundwater Availability

The net dynamic ground water availability at year 2010 in ACZ III (a) is 1,591.61 Mm^3 and ground water abstraction is 2,668.27 Mm^3. The stage of ground water development in zone is 167.65% and is categorised as over-exploited zone. Saline ground water resource of the zone is assessed at 80.45 Mm^3.

The total static ground water resource in ACZ is assessed at 2,138.73 Mm^3, out of which 53.05 Mm^3 is saline ground water.

1. Groundwater Study of Agroclimatic Zone III (b)

1.1 General

The ACZ covers an area of 24,431.80 km^2 and comprises the districts of Alwar, Bharatpur, Dhaulpur, Karauli, Sawai Madhopur and Dausa. The average annual rainfall in zone is 618.7 mm and mean annual evaporation 216.7 mm.

1.2 Geology

Like any other northern area of Rajasthan, this ACZ also mostly comprises Quaternary alluvium. The central part of the ACZ is occupied with quartzite of Pre-cambrian age. The southern and eastern part occupied with Vindhyan group of rocks that comprise assemblage of sandstone, shale and limestone rocks.

1.3 Hydrogeology

The hydrogeological map of ACZ III (b) is given in Drawing No. ACZ III(b)-001. The hydrogeological description of water bearing formation ACZ III (b) is given in following paragraph.

Older Alluvium

The Older alluvium aquifer in Alwar district of ACZ IIIb has been explored to a depth of 160 m. The static water level in the aquifer ranges from 5.50 to16.30 m below ground level. This aquifer is capable of supporting production tube wells to yield from 4.16 lps to 11.20 lps discharge in the depth zone of 56.50 to 158 m for a drawdown of 4.10 to 24.00 m. The transmissivity of aquifer system ranges from 27 to 357 m^2/day.

This aquifer in Bharatpur district in the depth range of 16 to 157 m is capable of yielding a discharge of 0.77 to 42.00 lps. The static water level of aquifer system in this area ranges from 1.63 to 17.20 m. The pressure heads which were variously at 0.47 to 1.79 m above ground level have now reportedly gone down below ground surface.

In Karauli district, this aquifer in the depth range of 63 to 157 m is capable of producing water yield of the order of 12.93 to 21.67 lps. The static water level in the aquifer in Karauli district part of the aquifer ranges from 2.45 to 12.60 m below ground level. The transmissivity of aquifer unit in the area ranges from 22 to 413 m^2/day.

In Dhaulpur district, Older alluvium aquifer unit between 38 and 56 m depth zone is capable of producing discharge of the order of 10.53 to 12.12 lps. The static ground water level in this unit in Dhaulpur part of ACZ ranges from 6.96 to 19.11 m bgl. The transmissivity of aquifer in this area as per available data ranges from 70 to 237 m^2/day.

Younger Alluvium

The Younger alluvium aquifer unit is present in small part of Dausa district. This unit in varying depth of 85 to 89 m is capable of producing discharge of 0.83 to 12.60 lps. The static ground water level of the unit ranges from 3.95 to 13.85 m below ground level. The transmissivity of the aquifer ranges from 43 to155 m^2/day.

Bhander Sandstone

The sandstone of the Vindhyan Super Group occupies a large area in Dhaulpur and Karauli Districts and a small area in Bayana Block of Bharatpur District. The sandstone is pink to red, fine to medium-grained, consolidated to semi-consolidated. It is porous at places and inter-bedded with shale and limestone in the area around Sapotara and Hindaun blocks of Karauli district. It is jointed and fractured and is characterized by low specific yield. Groundwater occurs under unconfined conditions. The yield of the tube-wells located in Bhander Sandstone ranges from 1.16 to 11.58 lps.

Slate

This lithological unit is part of the Delhi Super Group. The slates are usually dark coloured, soft and friable argillaceous meta-sediments. Its occurrence is mainly in Thanagazi Block and in small areas in Reni Block of Alwar District. It has a low groundwater exploitation potential.

Quartzite

The quartzites belong to the Delhi Super Group and Bhilwara Super Group. The Delhi quartzites are found in (a) Rajgarh Block, (b) small areas in Umrain and Kishangarh blocks of Alwar district, (c) western part of Nadoti block of Karauli district and (d) small areas near Weir block of Bharatpur district. The Delhi Super Group quartzites are fine grained, grey to pink in colour, thickly bedded and well jointed. The Bhilwara Super Group quartzites are micaceous, gritty and conglomeratic.

Limestone

Both Bhander and Alwar limestone formations have been grouped one unit as limestone aquifer unit. Whereas Bhander limestone has been explored to a depth of about 87 m, the Alwar limestone has been explored to a depth of 127.7 m. The static water level (bgl) in Bhander limestone aquifer has a range of 11.76 to 23.13 m. The Alwar limestone has an average static water level (bgl) of 27 m. The yield potential of Bhander limestone by tube wells is upto 15 lps and of Alwar limestone it is upto 14.2 lps.

Phyllite and Schist

The Phyllite and Schist aquifer unit occur in Alwar and Sawai Madhopur districts. Aquifer unit have been explored to a depth of 202.7 m. The static water level of aquifer units is in the range of 4.94 to 87.30 m. The yield potential of wells in this unit ranges from 0.17 to 20.0 lps.

1.4 Main Aquifers units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Table 1.4-1 Main Aquifer Units of ACZ III (b)

District	Block	Aquifer Units	Area (Km^2)

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
   Detailed information on location/village for the above observed parameter values is given in Table 7 of Annex 2(b)

From Table 1.5-1 it may be observed that explored aquifer depth of older Alluvium aquifer unit of ACZ IIIb ranges from 12.80m (Village Jajore, block Kishangarh Bas, district Alwar) to 210.64m (Village Kumher-III, block Kumbher, district Bharatpur); the SWL (bgl) from 0.05m (Bharajpur Village Sewar block, district Bharatpur) to 96.15m (Village Sirwa, block Bansur, district Alwar) and discharge from 0.01 lps (Village Malakhrta, block Umren, district Alwar) to 700 lps (Village and block Behror, district Alwar).

In Sedimentary aquifer of ACZ IIIb the explored depth ranges from 31.32m in Bhander Sandstone (Village block and district Dhaulpur) to 201m in Bhander Sandstone (Village Satlana, block and district Karauli) the SWL (bgl) from 2m in Bhander Sandstone (Village Khanpur, block Bari district Dhaulpur) to 36.50m in Limestone (Village Choth ka Barwara, block Bonli district Sawai Madhopur) and discharge from 0.13 lps in Limestone (Village Dhamred, block Rajgarh, district Alwar) to 50 lps in Limestone (Village Choth ka Barwara, block Bonli, district Sawai Madhopur).

In hard rock aquifer unit of the ACZ the explored aquifer depth have a range from 34.43m (Village Malamachor, block Bonli, district Sawaimadhopur) to 202.70m (Village and block Thanagazi, district Alwar) the SWL (bgl) from 3.70m (village Pratapgarh, block Thanagazi, district Alwar) to 60m (Village Jetpura, block Weir, district Bharatpur) and discharge from 0.13 lps (Village Bar ke Bala ji, block Thanagazi district Alwar) to 25 lps (Village Choroti Nasopur, block Ramgarh district Alwar).

1.6 Sub-surface Geology

Sub-Surface Geological Section A-A'

As may be seen from this section (Figure 1.6-1 and Figure 1.6.2), a sandstone rock outcrop separates the alluvial aquifer regime into two small and separate realms. The sandstone forms a mound in the area. In the western part, between Karauli and Meena Para, the alluvium is 30 to 50 m thick, underlain by phyllite & schist. The alluvium has a saturated zone of about 6.5 m thickness. In the eastern part, across the sandstone exposure, the thickness of alluvium is 57 m, below which exists bedrock. The saturated thickness of alluvium in this area is about 18 m.

Sub-Surface Geological Section Along B-B'

The cross – section B-B' (Figure 1.6-3) has been drawn from NW to SE, the area generally have an extensive alluvial aquifer system. Alluvial aquifers predominate in the central part of the ACZ, flanked by quartzite and sandstone exposed outcrop around Alwar and Dhaulpur areas. In the central part, a sub-surface faults offset schistose and quartzite units between elevations 100 and 150 m.

The alluvial aquifer in the central part has a thickness ranging from 54 to 132 m. The saturated thickness ranges from 12 to 48 m. Bedrock below the alluvium exits at the depth range of 54 to 120 m.

Sub-Surface Geological Section Along C-C' and D-D'

The two sub-surface hydrogeological Sections along C-C' and D-D' (Figure 1.6-4 and Figure 1.6.5) run in SW-NE and NS direction respectively in southern part of ACZ IIIb in Bharatpur district. These sections have been taken from "Ground Water Resources of Banganga River Basin Report (December 1980) by CGWB western region Jaipur".

1.7 Depth to Groundwater

The depth to water table map of pre and post-monsoon period (2010) of this ACZ are at Drawing No. ACZ III(b)-003 and Drawing No. ACZ III(b)-004 respectively. The pre-monsoon depth to ground water level in pre-monsoon as can be seen from Drawing No. ACZ III(b)-003 was 5 to 40m (bgl). The post-monsoon (2010) registered rise in Bharatpur, Dhaulpur and Karauli districts locally, as can be seen from the occurrence of mapped zones of shallow ground water level depth of less than 2m (bgl) and of 2 to 5 m (bgl) in post-monsoon map of ACZ.

1.8 Ground water Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ III(b) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-wise / Aquifer-wise fluctuation in levels of ground water-ACZ III (b)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)
Alwar	Bansur	Older Alluvium	12	-0.41	1.90	0.45

ACZ Summary			**500**	**-6.93**	**10.76**	**2.12**

Source: CGWB and RGWD

It can be seen from the table that average ground water level fluctuation in the ACZ in Older alluvium aquifer ranges from 0.01m in Kathumar block of Alwar district to 5.24 m in Bonli block of Sawai Madhopur district. The average ground water level fluctuation in sedimentary aquifer ranges from 0.94 m (Bhander sandstone) in Hindaun block of Karauli district to 6.42 m (Limestone) in Rajgarh block of Alwar district. In hard rock aquifers the average ground water level fluctuation ranges from -2.06 m (Quartzite) in Tijara block of Alwar district to 5.25 m (Slate) in Thanagazi block of Alwar district.

1.9 Ground water Levels and Flow Directions

ACZ IIIb constitutes parts, differing in aerial extension, of eight river basins, namely the Banas, Chambal, Parbati, Gambhir, Banganga, Ruparail, Sabi and Shekhawati basins respectively. Each river basin has its own surface and groundwater regimes which are usually interrelated and of the same trend. In each and every basin the groundwater contours converge towards the surface channels, both heading to the same outlet direction (Figure 8.3). Pre-monsoon base-flow phenomena are not unusual along the rivers, mainly in the mountainous, upstream portions of the river channels.

In the south west, within the small area of the Banas River Basin, groundwater drainage pattern is parallel to the Banas River, which flows into the huge Chambal River outside the ACZ area. In the east, the groundwater of the Chambal, Parbati, Gambhir, Banganga and Ruparail parts of the ACZ are drained towards the state of UP whereas in the north the Sabi and Shekhawati pieces of the ACZ are drained into the state of Haryana (Map ACZ IIIb-002).

The main operative aquifers in this ACZ are the Older Alluvium, all over the area and the Bhander Sandstone, mainly in the south. The alluvial aquifers seem to be perched on top of semi-impervious formations such as the Quartzite, the weathered, upper part of which functions as an aquifer, of rather low hydraulic properties. The Quartzite and Limestone are mainly encountered in the Sabi and upstream Banganga basins area, and some Shale, Slate, Phyllite & Schist and Younger Alluvium country rocks occupy some limited areas in this ACZ (Map ACZ IIIb-001).

Groundwater table contour map of ACZ is at Drawing No. ACZ III(b)-002. Hydraulic gradients are usually moderate to almost flat, less than 1m per km, in the alluvial areas, whereas steeper gradients, which point to lower to much lower transmissivity values, characterize the hilly areas such as the Alwar district in the west. The water level depth may also serve as an indication of hydraulic characteristics, such as is the case of the hilly areas and along the basin boundaries, where shallow depth points to poor hydraulic properties. Shallow water level, sometimes less than 10m bgl within the Older Alluvium aquifer (such as Kotkasim and Tijara blocks of the Sabi Basin, the Kaman block of the Ruprail Basin and the Sewar block of the Banganga basin) in the outlet areas is an indication, in the particular case of this ACZ, to the proximity of the Yamuna (saline) groundwater regime. Areas where water level is less than 8m are advantageous in terms of groundwater draft by means of centrifugal pumps. Maximal water level depth, of about 30 – 40m bgl, is recorded in the Older Alluvium aquifer of the Banganga Basin (Map ACZ IIIb-003).

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ III(b) are shown in Figure 1.10-1 to 1.10-36. The supportive data for the same is given in Annex 9.

1.10.1 Sawai Madhopur District

The pre-monsoon average groundwater levels in Sawai Madhopur district in the year 1984 vary between a minimum of 247.48 m amsl (Gangapur block) and maximum of 256.29 m amsl (Bonli block) while in the year 2010 the pre-monsoon average ground

water level vary between a minimum of 240.58 m amsl (Gangapur block) and a maximum of 248.49 m amsl (Bonli block). Long-term ground water levels in each block are presented in Figure 1.10-1 to 1.10-3. The level change rates are given in Table 1.10-1.

The pre-monsoon levels in various blocks of the district have a declining rate of -0.09 m/yr in Bamanwas block to -0.23 m/yr in Bonli block. The post-monsoon levels have a declining level rate of -0.08 m/yr in Bamanwas Block to -0.23 m/yr in Bonli Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Bonli block where average groundwater levels are predicted to reach 237.46 m amsl by the year 2060, 11 m below current stages. As a result, 92% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.2 Karauli District

The pre-monsoon average groundwater levels in Karauli district in the year 1984 vary between a minimum of 224.89 m amsl (Hindaun block) and maximum of 277.02 m amsl (Karauli block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 216.60 m amsl (Hindaun block) and a maximum of 272.59 m amsl (Karauli block). Long-term ground water levels in each block are presented in Figure 1.10-4 to 1.10-8. The level change rates are given in Table 1.10-1.

In various blocks of Karauli district, the rate of pre-monsoon level decline ranges from -0.08 m/yr in Karauli block to -0.42 m/yr in Todabhim Block. In post-monsoon the rate range from -0.07 m/yr in Nadoti Block to -0.37 m/yr in Todabhim Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Todabhim block where average groundwater levels are predicted to reach 198.90 m amsl by the year 2060, ~20 m below current stages. As a result, 92% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.3 Dhaulpur District

The pre-monsoon average groundwater levels in Dhaulpur district in the year 1984 vary between a minimum of 150.56 m amsl (Rajakhera block) and maximum of 218.29 m amsl (Baseri block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 143.03 m amsl (Rajakhera block) and a maximum of 215.47 m amsl (Baseri block). Long-term ground water levels in each block are presented in Figure 1.10-9 to 1.10-12. The level change rates are given in Table 1.10-1.

In various blocks of district, the pre-monsoon levels declining rate range from -0.05 m/yr in Bari block to -0.23 m/yr in Rajakhera Block. In Post-monsoon period the rate ranges from -0.05 m/yr in Bari block to -0.20 m/yr in Rajakhera block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Rajakhera block where average groundwater levels are predicted to reach 132.62 m amsl by the year 2060, 10 m below current stages. As a result, 79% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.4 Bharatpur District

The pre-monsoon average groundwater levels in Bharatpur district in the year 1984 vary between a minimum of 171.84 m amsl (Sewai block) and maximum of 208.77 m amsl (Weir block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 168.20 m amsl (Sewar block) and a maximum of 200.42 m amsl (Weir block). Long-term ground water levels in each block are presented in Figure 1.10-14 to 1.10-23. The level change rates are given in Table 1.10-1.

In various blocks of the district the rate of decline in levels ranges from -0.03 m/yr in Kumher block to -0.29 m/yr in Nadbai block. In post-monsoon period the rate ranges from -0.02 m/yr in Deeg and Kumher Blocks to -0.28 m/yr in Nadbai Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Nadbai block where average groundwater levels are predicted to reach 168.87 m amsl by the year 2060, 14 m below current stages. As a result, 83% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.5 Alwar District

The pre-monsoon average groundwater levels in Alwar district in the year 1984 vary between a minimum of 209.01 m amsl (Kathumbar block) and maximum of 402.61 m amsl (Thanaghazi block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 199.69 m amsl (Kathumbar block) and a maximum of 393.22 m amsl (Thanaghazi block). Long-term ground water levels in each block are presented in Figure 1.10-24 to 1.10-37. The level change rates are given in Table 1.10-1.

The rate of decline in various block of the district in pre-monsoon period ranges from -0.07 m/yr in Rajgarh Block to -1.33 m/yr in Behror Block. In post-monsoon period the rate has range from -0.05 m/yr in Rajgarh to -1.38 m/yr in Behror Block. The steep decline is ascribed to heavy withdrawals of groundwater in the area.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Behror, Kathumar, Kotkasim, Mandawar and Nimrana Blocks where average groundwater levels are predicted to reach 197.32, 185.84, 232.95, 246.79 and 226.50 m amsl (respectively) by the year 2060, ~63 m below current stages. 100% of the monitoring wells (CGWB & RGWD) in the block will dry (in Behror and Nimrana they are already dry during 2010).

1.10.6 Dausa District

Mahwa block is the only block that belongs to Dausa District in ACZ IIIb. Average groundwater levels this block drop from a maximum of 239.07 m amsl in 1985 (post-monsoon) to a minimum of 225.37 m amsl in 2009 (pre-monsoon) (Figure 1.10-13). This significant decline is typical to the alluvial formation that allows high draft rates of the groundwater.

Table 1.10-1 Long-term Groundwater Levels Change Rates– ACZ III (b) 1984-2010

District	Block	Main Formation	Pre Monsoon					Post Monsoon				
			Water Level [m amsl]		Change Rates [m/y]			Water Level [m amsl]		Change Rates [m/y]		
			1984	2010	Average	Min	Max	1984	2010	Average	Min	Max

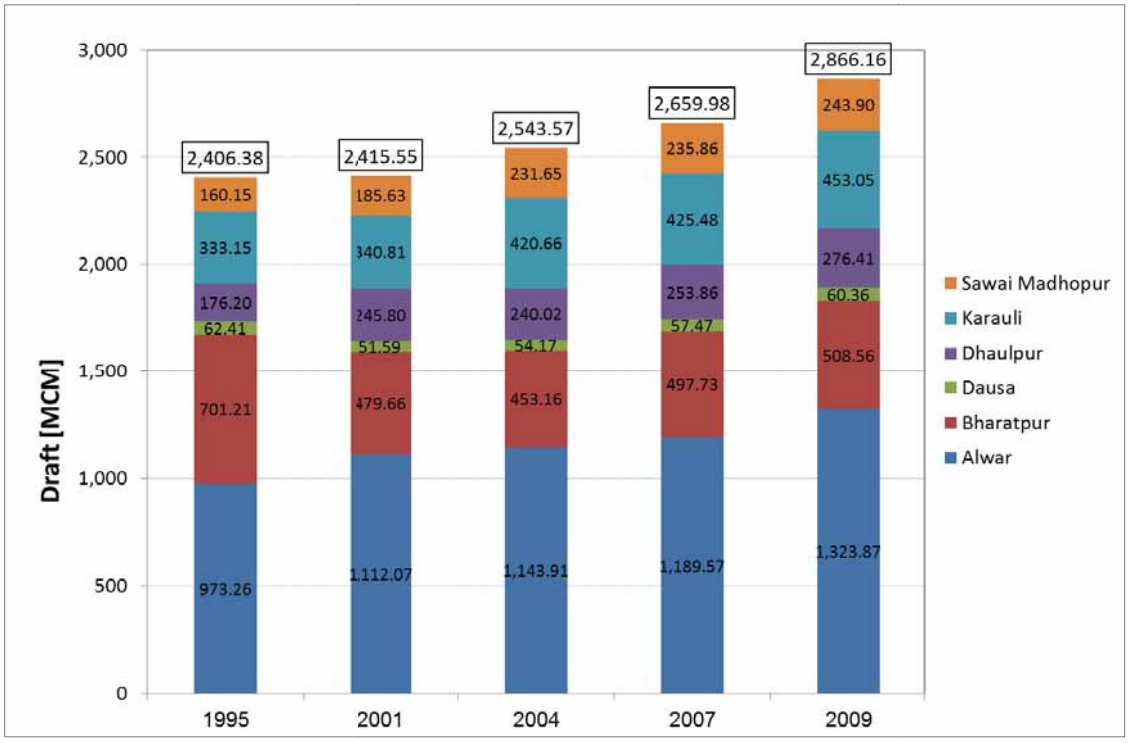
1.11 Long-Term Drafts

Figure 1.11-1 presents the total groundwater draft in ACZ IIIb by districts for the years 1995, 2001, 2004, 2007 and 2009. The source of data is the Report on Dynamic Groundwater Resources of Rajasthan (by CGWB and RGWD). Table 1.11-7 and Figure 1.11-2 present the groundwater draft per year per district (and per block) according to the type of usage, e.g. agriculture vs. domestic and industrial use. The graph clearly shows the significant difference between the groundwater draft for irrigation and other usages. Usually, in most districts, the drafts for domestic and industrial purposes are in the range of 5 to 10% of the total groundwater draft in the district (see Table 1.11-7). Sawai Madhopur is the only district where domestic and industrial usage is more significant, comprising 15-18% of the total groundwater draft (see Table 1.11-7). Figures 1.11-3 to 1.11-8 present the draft data in each district according to blocks. Few general observations can be derived from these graphs:

- Total groundwater draft increased from 2,406 Mm^3 1995 to 2,866 Mm^3 2009 - an increase of ~20% in 15 years.
- The only district where significant reduction in groundwater draft was noticed between the years 1995 and 2004 is Bharatpur. The part of Dausa district within ACZ IIIb also presents some decrease in draft between 1995 and 2001. Drafts in all other years and districts are in constant rise.
- Alwar district is the main consumer in this zone, utilizing almost 50% of the total consumption in the entire ACZ.
- Bharatpur and Karauli are the second largest consumers, with 16 - 20% of the total consumption.
- Groundwater consumption in Sawai Madhopur and Dhaulpur are similar, in the range of 8 to 10% of the entire ACZ.
- Dausa District is using only about 2% of the total groundwater in the zone.

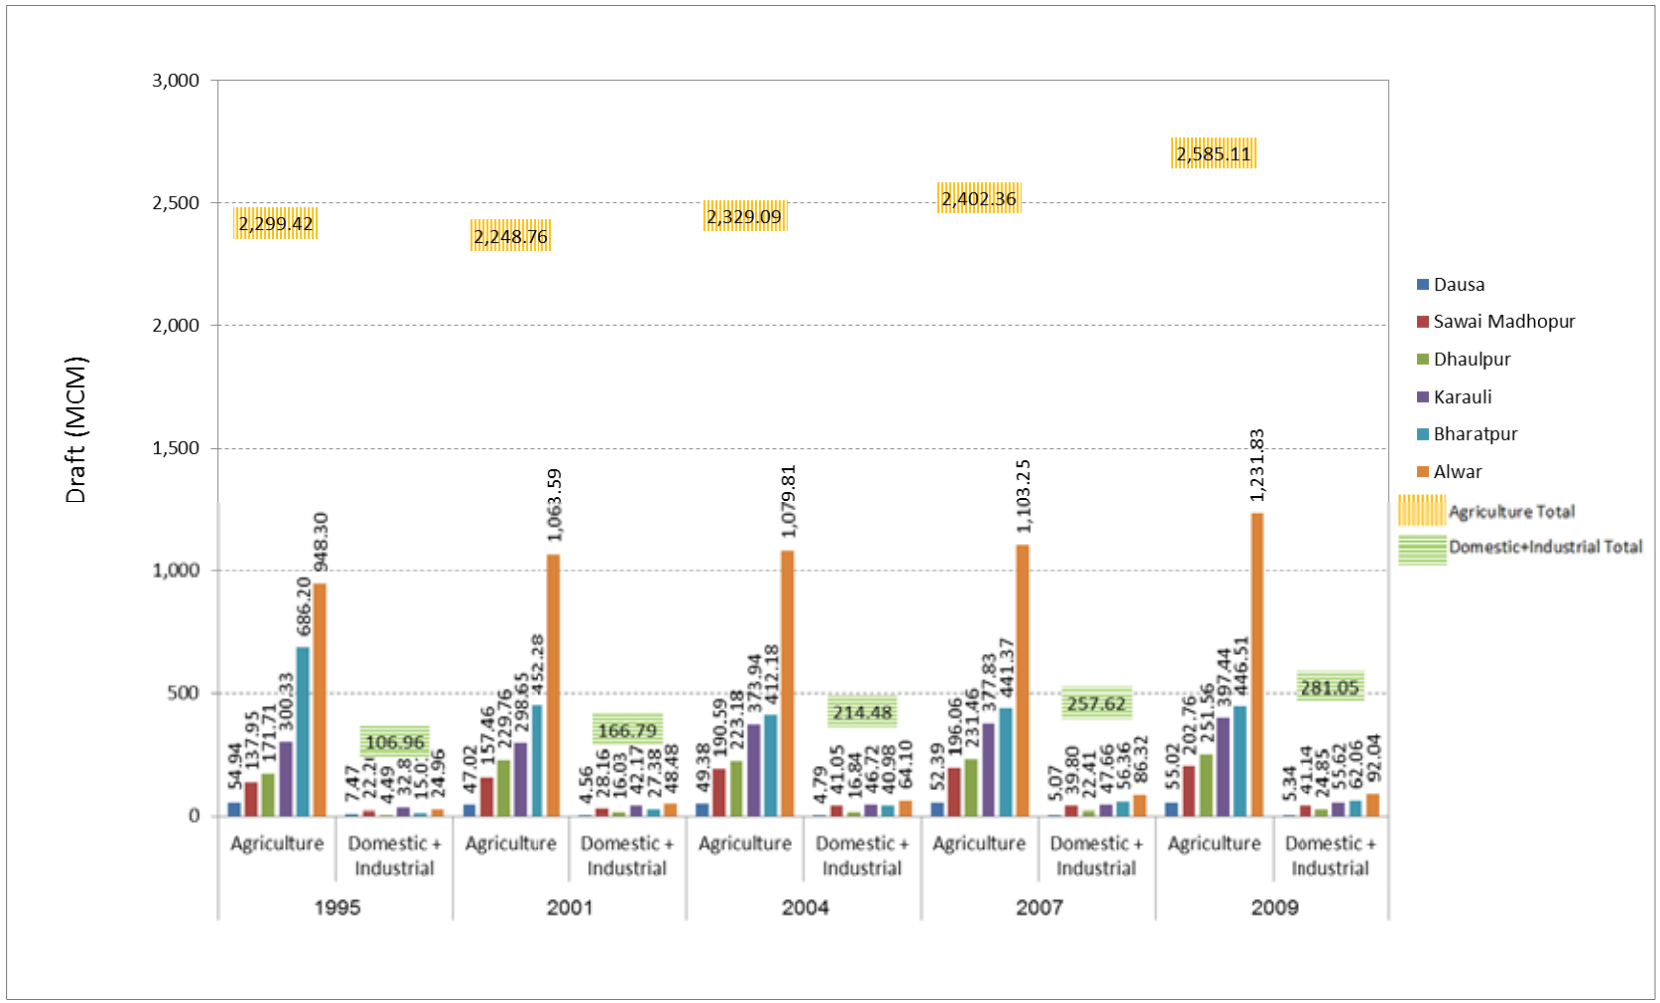
Total groundwater draft in this ACZ in 1995 and 2001 was almost the same, with a negligible increase of about 11 Mm^3. However, in the following years, exploitation increased every 2 - 3 years by approximately 5 - 8%. Accordingly, the total groundwater draft in 2009 was 20% higher than the draft in 1995. The relative increase in draft for domestic and industrial purposes was much higher (163%) than that for agriculture purposes (12%; Table 1.11-7).

Figure 1.11-1 Total Groundwater Draft in ACZ IIIb by Districts (1995-2009)



Source: CGWB and RGWD

Figure 1.11-2 Groundwater Draft for Agriculture and Other Uses in ACZ IIIb by Districts



Source: CGWB and RGWD

1.11.1 Dausa District

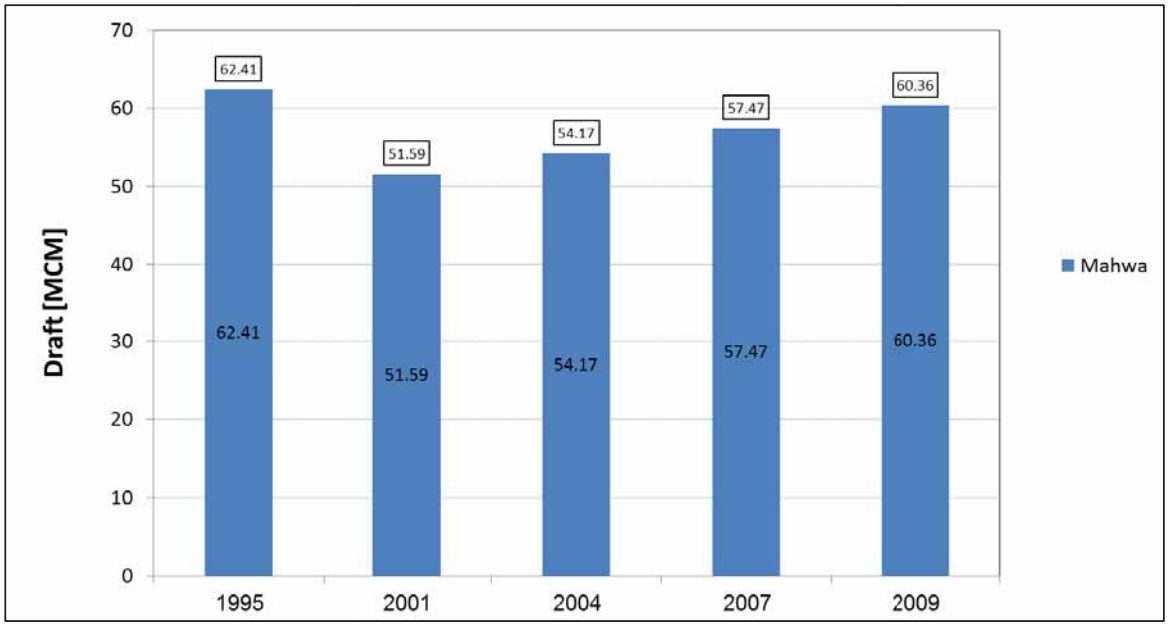
The only block in Dausa district falling within ACZ IIIb is Mahwa. Total groundwater abstraction in Mahwa block in 2009 reached 60 Mm^3/yr. Groundwater consumptions for domestic and industrial uses is approximately 5 Mm^3, which is ~9% of the total draft (Table 1.11-7, Figure 1.11-2). Between 1995 and 2001 a decrease in groundwater abstraction was recorded, both for agriculture and for domestic and industrial uses (Figure 1.11-3, Table 1.11-7). Since then, groundwater abstractions for both purposes increased gradually by approximately 5% every 2 - 3 years.

Table 1.11-1 Total Change in Groundwater Draft - Dausa District (within ACZ IIIb) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Mahwa	0.15%	-40%	-3%

Source: CGWB and RGWD; Supportive data is located in Table 1.11-7

Figure 1.11-3 Total Groundwater Abstraction in Dausa District (within ACZ IIIb) by Blocks



Source: CGWB and RGWD

1.11.2 Sawai Madhopur District

Total groundwater draft in this district reached 244 Mm^3/yr in 2009. Draft distribution in 2009 was approximately 60-70 Mm^3/yr in Bamanwas and Bonli blocks and 106 Mm^3/yr in Gangapur block. In the years 1995 to 2009, total groundwater exploitation in this district increased by 52% (Table 1.11-2), from 160 Mm^3/yr in 1995 to 244 Mm^3/yr in 2009. In Bamanwas block, groundwater development increased by 162% in just 15 years (Figure 1.11-4, Table 1.11-2). Groundwater exploitation for domestic and industrial uses comprises between 11% (in Bamanwas block) and up to 21% (in Bonli block) of the total draft. Except for Bamanwas block (Table 1.11-7), the relative increase in groundwater abstraction for domestic and industrial purposes during 1995 to 2009 was much higher than the increase in agriculture utilization (see Table 1.11-7). In all the blocks, the drafts volume from groundwater increased consistently from year to year. The only example for reduction in groundwater consumption in the last 15 years is in Bonli block between 2004 and 2007(total abstraction decreased from 70 to 64 Mm^3 (Figure 1.11-2, Figure 1.11-4, Table 1.11-2 and Table 1.11-7).

Table 1.11-2 Total Change in Groundwater Draft – Sawai Madhopur District (within ACZ IIIb) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bamanwas	169%	116%	162%
Bonli	31%	91%	40%
Gangapur	17%	71%	24%
District Total	**47%**	**85%**	**52%**

1.11.3 Dhaulpur District

Total groundwater abstraction in this district in 2009 reached 276 Mm^3/yr. The main groundwater consumers are Dhaulpur block (109 Mm^3/yr) and Rajakhera block (72 Mm^3/yr; Figure 1.11-5). Only 9% of the total exploited groundwater is being used for domestic and industrial purposes while all the rest (91%) are utilized for irrigation. However, the volumes of groundwater draft for domestic and industrial uses increased significantly in the last 15 years - from 4.5 Mm^3/yr in 1995 to 24.85 Mm^3/yr in 2009 – a rise of 454%. At the same time, draft for agriculture increased by "only" 47% (from 171 Mm^3/yr to 251 Mm^3/yr; Tables 1.11-3 and 1.11-7). The main increase in groundwater abstraction took place between 1995 and 2001. A minor decrease in draft was recorded between 2001 and 2004 (-2%), followed by an increase of 6% and 9% in 2007 and 2009, respectively. Dhaulpur block is presenting a steady increase in groundwater draft since 1995 at a relatively high rate. Until 2007, groundwater exploitation increased annually by 2 - 4% on average (Figure 1.11-5). Between 2007 and 2009 the rate of increase rose to 10%/yr. 94% of the groundwater in 2009 in this district was used for irrigation.

Table 1.11-3 Total Change in Groundwater Draft - Dhaulpur District (within ACZ IIIb) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bari	25%	>+500%	43%
Baseri	59%	>+500%	75%
Dhaulpur	65%	380%	73%
Rajakhera	30%	260%	37%
District Total	**47%**	**454%**	**57%**

1.11.4 Karauli District

Total groundwater abstraction in this district reached 453 Mm^3/yr in 2009. Draft volumes in 2009 varied between 90 and 120 Mm^3/yr in all blocks except Nadoti, where the total draft was only 32 Mm^3/yr. Groundwater exploitation for domestic and industrial uses comprise between 8 and 9% of the total draft in Hindaun and Sapotra blocks, reaching up to 22% in Nadoti block. In most of the blocks the increase in exploitation for domestic and industrial purposes during the period 1995 - 2009 was much higher than the increase in draft for agriculture (see Table 1.11-4). The only block where groundwater exploitation for agriculture was higher is Saporta. While abstractions for agriculture in the entire district in 1995 summed up to 300 Mm^3/yr and for domestic and industrial uses - 33 Mm^3/yr, by 2009 the volumes of groundwater exploitation for agriculture rose to 397 Mm^3/yr (+32%) and for domestic and industrial uses – 55 Mm^3/yr (+69%).

Table 1.11-4 Total Change in Groundwater Draft - Karauli District (within ACZ IIIb) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Hindaun	2%	68%	6%
Karauli	34%	176%	45%
Nadoti	62%	109%	70%
Sapotra	139%	39%	124%
Todabhim	14%	33%	17%
District Total	**32%**	**69%**	**36%**

1.11.5 Bharatpur District

Total groundwater abstraction in this district in 2009 reached 509 Mm^3/yr. The largest amounts of groundwater are being pumped in the following blocks: Sewar, Nadbai, Roopwas, Weir and Bayana - each consuming more than 56 Mm^3/yr (Sewar block) and up to 81 Mm^3/yr (Bayana block; Figure 1.11-7). In most blocks, groundwater for domestic and industrial purposes comprises 7 - 14% of the total draft. However, in Kumher and Sewar blocks these sectors extract significantly higher quantity and reach 27% of the total groundwater exploitation during 2009 (Table 1.11-7). Exploitation trends in this district are interesting. Between 1995 and 2001 a major decrease in total groundwater exploitation took place in all the blocks – from -7% in Kaman and Bayana blocks up to -63% in Kumher block. Another small decrease in groundwater abstraction was recorded between 2001 and 2004. From 2004 onwards, small increases in total groundwater draft were recorded (12% until 2007 and another 2% in 2009; Figure 1.11-7). Bharatpur is the only district in ACZ IIIb where total draft in 2009 was significantly smaller than in 1995. The total decrease in groundwater draft in Bharatpur District between 1995 and 2009 is detailed in Table 1.11-5. Interestingly, while the draft for agriculture purposes decreased significantly between 1995 and 2009 (up to -70% in Kumher block), there was a major increase in groundwater exploitation for domestic and industrial purposes in the range of +187% in Kaman block up to +649% in Weir block. Still, because the amounts exploited for agriculture are much higher, the overall outcome is a prominent decrease in total draft in this district (Table 1.11-5).

Table 1.11-5 Total Change in Groundwater Draft - Bharatpur District (within ACZ IIIb) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bayana	-8%	385%	-2%
Deeg	-34%	226%	-28%
Kaman	-10%	187%	-3%
Kumher	-70%	354%	-59%
Nadbai	-41%	267%	-37%
Pahari	-35%	269%	-27%
Rupbas	-22%	201%	-18%
Sewar	-69%	337%	-59%
Weir	-11%	649%	0%
District Total	**-35%**	**313%**	**-27%**

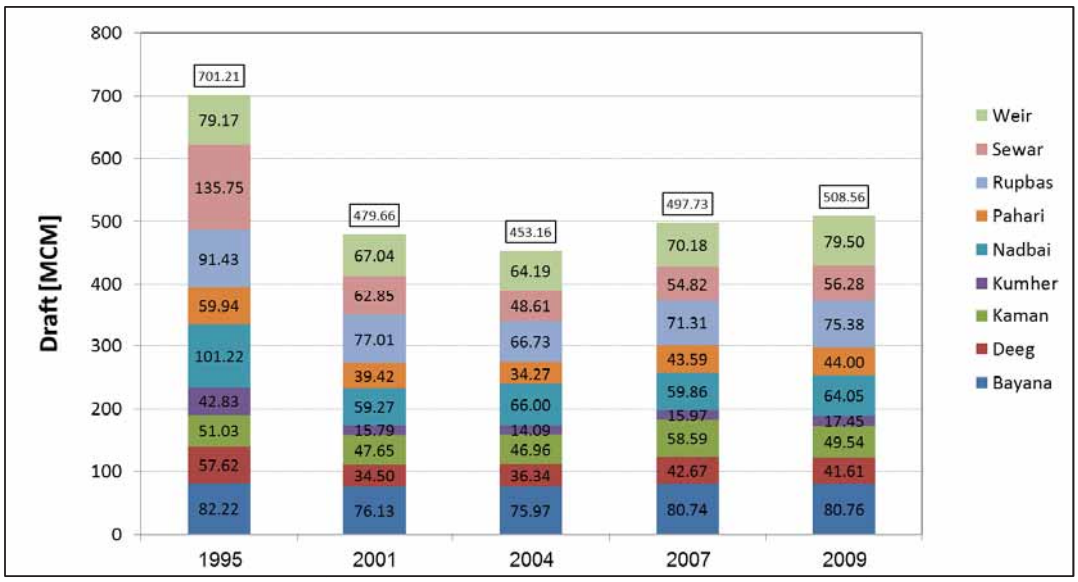
Figure 1.11-7 Total Groundwater Draft in Bharatpur District (within ACZ IIIb) by Blocks



Source: CGWB and RGWD

1.11.6 Alwar District

Total groundwater abstraction in this district in 2009 reached 1,324 Mm^3/yr. The largest amounts of groundwater are being draft in the following blocks: Behror, Ramgarh, Tijara, Bansur, Mandawar and Umrain - each one consuming from 101 Mm^3/yr (Behror block) to 152 Mm^3/yr (Umrain block; Figure 1.11-8). Umrain block presents significantly high groundwater consumption for domestic and industrial uses – up to 30 Mm^3/yr in 2009, which is 20% of the total consumption in this block. In all other blocks, domestic and industrial uses comprise 3 - 9% of the total consumption. Although the draft for domestic and industrial uses comprises merely few percent of the total abstraction in this district, the relative increase in these uses was significantly higher than the agricultural consumption. Between 1995 and 2009, groundwater draft for agriculture rose from 948 to 1,231 Mm^3/yr, an increase of 30%. At the same time, abstractions for domestic and industrial uses rose from 25 Mm^3/yr to 92 Mm^3/yr, an increase of 269%. The fraction of groundwater for domestic and industrial uses from the total draft in the district rose in these years from 3% to 7%. The main increase in domestic consumption took place between 1995 and 2001, probably due to improvement in the standard of living in the rural areas (Table 1.11-7). All blocks exhibit consistent increase in the total groundwater exploitation over the years 1995 to 2009. However, the magnitude of increase is different from block to block (see Table 1.11-6).

Table 1.11-6 Total Change in Groundwater Draft - Alwar District (within ACZ IIIb) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Behror	36%	436%	44%
Bansur	113%	545%	119%

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 5697 villages in ACZ III(b), 3229 are found suitable for drinking water use, 3449 for irrigation use and 5026 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in ground water is summarised in Table 1.12-1.

Table 1.12-1 Village and block wise water quality

ACZ	District	Block	Total Number of Villages	Electrical Conductivity, µS/cm			Chloride, mg/l			Fluoride, mg/l			Nitrate, mg/l		
				Highest Desirable Limit: 750	Maximum Permissible Limit: 2,250	Above Maximum Permissible Limit: 2,250	Highest Desirable Limit: 250	Maximum Permissible Limit: 1000	Above Maximum Permissible Limit: 1000	Highest Desirable Limit: 1.0	Maximum Permissible Limit: 1.5	Above Maximum Permissible Limit: 1.5	Highest Desirable Limit: 45	Maximum Permissible Limit: 100	Above Maximum Permissible Limit: 100

Source: CGWB and RGWD

It may be seen from above that out of 5697 villages of ACZ IIIb, 2964 fall under desirable, 1907 under maximum permissible limit and 826 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 3383 while number of villages with maximum permissible limit of use is 1139 and number of above maximum permissible limit for Fluoride is 1175. As regards presence of nitrate in ground water, 2999 fall under highest desirable limit of less than 45 mg/l and 1561 under maximum permissible limit along with 1137 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 2940 villages fall under maximum permissible limit and 2248 under above maximum permissible limit of 2250 microhos/cm and 509 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

i) Ground Water Quality of ACZ III (b) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ III(b) is shown in Drawing No. ACZ III(b)-005. Fresh ground water with chloride level zone of less than 250mg/l occur in most parts of Alwar, Karauli, Sawai Madhopur and Dhaulpur Districts. Mostly the eastern part of ACZ is occupied with high chloride level of 250-1000 and beyond 1000 mg/l concentrations in Bharatpur and Alwar districts and in parts of Sawai Madhopur and Dhaulpur districts.

Block-wise / aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in the Table 1.12-2.

Table 1.12-2 Percent area occupied with various level of Chloride in ground water of ACZ III (b)

ACZ IIIb Summary			**60.23**	**28.56**	**11.21**

Source: CGWB and RGWD

It may be seen from above that 60% area of ACZ is covered with potable quality ground water of <250 mg/l chloride concentration in various aquifer unit, of ACZ. About 90 to 100 % poor quality area belongs to Younger alluvium of Behror block of Alwar district and Bhander Sandstone of Rajakhera block of Dhaulpur district, where nitrate concentration ranges between 250 mg/l to more than 1000 mg/l.

ii) Ground Water Quality of ACZ III (b) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ III(b) is shown in Drawing No. ACZ III(b)-006. It may be seen that high level nitrate-rich ground water with concentration >100mg/l occur in isolated pockets mostly in Bharatpur and Sawai Madhopur district. A large part of Karauli and Dhaulpur districts is occupied with good quality ground water with concentration of < 45mg/l.

Block-wise / aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

Table 1.12-3 Percent area occupied with various level of Nitrate in ground water of ACZ III (b)

ACZ IIIb Summary			**52.26**	**27.82**	**19.92**

Source: CGWB and RGWD

As may be seen from above table, about 73% area of Dausa district, 63% of Alwar district, 59.4% of Karauli districts, 70.5% of Dhaulpur district are covered with potable quality ground water. All the aquifer units of Bamanwas block of Sawai Madhopur district are almost fully infested with poor ground water concentration of around 100 mg/l.

iii) Ground Water Quality of ACZ III (b) by fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ III(b) is shown in Drawing No. ACZ III(b)-007. It can be seen from the map that a large part in

the ACZ bear potable quality of water including Alwar, Dhaulpur and Karauli districts with Fluoride concentration less than 1.5 mg/l. However isolated pockets with high content of Fluoride beyond 1.5 mg/l occur in northern, north western, southern and eastern parts of the ACZ.

Block-wise/aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

Table 1.12-4 Percent area occupied with various level of Fluoride in ground water of ACZ III (b)

ACZ IIIb Summary			**60.99**	**20.75**	**18.26**

Source: CGWB and RGWD

It may be seen from the table that 81.74% area of the ACZ is comprising ground water with fluoride content less than 1.5 mg/l. Only 18.26% area is comprising poor quality of ground water with fluoride content beyond 1.5 mg/l.

iv) Ground Water Quality of ACZ by III (b) EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ III(b) is shown in Drawing No. ACZ III(b)-008. From map it can be seen that in most parts of Alwar, Karauli and Sawai Madhopur districts ground water of low salinity occurs with EC concentration ranging from less than 750 micromhos to 2250 micromhos/cm. High salinity ground water with EC in the range of 2250-5000 and beyond 5000 micromhos/cm occur in Alluvium aquifer units in Bharatpur district and in isolated pockets of Sawai Madhopur, Dhaulpur, Alwar district occupied with Sandstone, Alluvium, Quartzite and Phyllite/schist units.

Block-wise/aquifer-wise percent area occupied with various levels of EC in groundwater of ACZ is shown in Table 1.12-5.

Table 1.12-5 Percent area occupied with various level of EC in ground water of ACZ III(b)

ACZ IIIb Summary			13.36	54.76	22.97	8.91

Source: CGWB and RGWD

From the table it can be seen that 68.12% area of the ACZ bear low salinity ground water with EC concentration ranging from less than 750 to 2250 micromhos/cm and 31.88% area bear high salinity ground water with EC concentration ranging from 2250 to more than 5000 micromhos/cm. It is also depicted from the table that 100% area of Bhander sandstone aquifer unit in Rajakhera block of Dhaulpur district comprise high salinity ground water of 2250 to 5000 micromhos/cm; 90% younger alluvium in Weir block of Bharatpur district; 100% area of Limestone aquifer unit in Sapotra block of Karauli district comprise low salinity ground water of 750 to 2250 micromhos/cm.

1.12.3 Long-term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ III(b) are shown in Figure 1.12-1 to 1.12-72. The supportive data for the same is given in Annex 10.

Dhaulpur District

Average Chloride and EC concentrations for the period 1984 – 2009 are presented in Figures 1.12-1–1.12-7 (odd figures). The graphs demonstrate clearly the close correlation between the two parameters, since the Chloride is the dominant ion in all salinity ranges. The Long-term trends of average chloride values in Alluvial and Bhander Sandstone unit in blocks of Basseri, Bari, Dhaulpur and Rajakhera display a low to moderate increase from 200 to 400 and 500 mg/l, with fluctuating records that may reach about 600 mg/l in Rajakhera and Dhaulpur blocks, at the end of the decade. Lower records are displayed in the blocks of Baseri and Bari which seem to be "immuned" in respect to salinity impact from Uttar Pradesh thanks to the Chambal river along their south–east boundary, therefore the chlorine fluctuates within the range of 100 mg/l and 200 mg/l only, with one exceptional show of 400 mg/l in Baseri, in 2007. As of now there is no clear impact of the continuous water level depletion, about 4–6 m

in the last decade only but 5–15 m throughout the study period. All in all the chlorine values in the district are well below the maximum accepted for drinking (1000 mg/l).

EC trends follow very closely, almost parallel, the chloride trends. Average levels are almost stable along the 2000 µS/cm line in Rajakhera and Dhaulpur blocks and along the 1000 µS/cm average line in Baseri and Bari blocks. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ III(b)-009.

Average NO_3 and F levels per block for the period 1984–2010 are displayed in Figures 1.12-2–1.12-8 (even figures). In the blocks of Rajakhera and Dhaulpur both parameters are almost stable or slightly dropping, and the NO_3 fluctuates along the 100 mg/l line, with a few events of 200 mg/l. In the Bari and Baseri blocks the NO_3 is even lower, slightly fluctuating along the 50 mg/l average line.

Behaviour of the Fluorine concentration, the permissible limit of which is 1.5 mg/l, in the four blocks is not impressive, along the average line of 1mg/l, more than likely since the dominating lithology is just alluvium and sandstone. However, in the block of Baseri, probably due to a reason unknown, there are two events of 2.5 and 2 mg/l records, in 1989 and 1999, respectively.

It is somewhat surprising that phenomena of salinization as a consequence of water level depletion and the saline water on the UP side of the border are not encountered, so far in the Rajakhera and Dhaulpur blocks. Severs impacts of this process can be seen, however, in the Bharatpur district, to the north of Dhaulpur district.

Karauli District

Average Chloride and EC concentrations for the period 1989–2009 are presented in Figures 1.12-9 to 1.12-17(odd figures). The graphs demonstrate clearly the close correlation between the two parameters, since the Chloride is the dominant ion. The Long-term trends of average chloride values in the mainly alluvial blocks of Todabhim, Nadoti and Hindaun display a moderate increase from 300 to 400 and 500 mg/l, with fluctuating records that may reach 600 and 700 mg/l in Todabhim and Nadoti at the end of the decade. The blocks of Sapotra and Karauli (mainly Bhander Sandstone) seem to be "immuned" in respect to salinity impact from Uttar Pradesh thanks to the Chambal River along the south–east Rajasthan border, therefore the chlorine fluctuates within the range of 100 mg/l and 200 mg/l only, with one exceptional show of 400 mg/l in Karauli, in 2004. In Sapotra block average chloride is even somewhat dropping from 1989 to 2009 (see Figure 1.12-9), along with about 5m water level depletion. All in all the chlorine values in the district are well below the maximum accepted for drinking (1000 mg/l).

EC trends follow very closely, almost parallel, the chloride trends. Average levels fluctuate between 2000 and 4000 µS/cm in Todabhim block and between 2000 µS/cm and 5000 µS/cm in Nadoti block, but are rather low in Sapotra and Karauli blocks, less than 1000 mg/l and even moderately decreasing. In Hindaun, it fluctuates along the 2000 µS/cm line value.

Average NO_3 and F levels per block for the period 1996 – 2009 are displayed in Figure 1.12-10–1.12-18 (even figures). In the blocks of Karauli, Todabhim, Sapotra and Nadoti both parameters are moderately decreasing, but in the Hindaun block they are increasing. In Karauli block the NO_3 value fluctuates between 250 and 150 mg/l, in Sapotra, Todabhim and Nadoti it drops to less than 100 mg/l in 2009 but in Hindaun

block, due to a reason unknown, it is increasing from about 50 to 200 mg/l in 2009, and two higher events, of 300 and more in 2005 and 2007, respectively.

Behaviour of the Fluorine concentration, the permissible limit of which is 1.5 mg/l, in the blocks of Sapotra, Todabhim, Nadoti and Karauli is rather unimpressive, from 1mg/l to less than 1 mg/l, more than likely since the dominating lithology is just alluvium and sandstone. However, in the block of Hindaun, probably due to some association with Basement rocks at the boundary of the Gambhir and Banganga river basins (see geological map) the fluorine concentration is different, with an average value of 1 mg/l in 1995 to 2 mg/l in 2009 and isolated high event of 5 mg/l in 2007.

Water level in all five blocks of the Karauli district is steadily depleting, mainly in the last decade, by about 5 mts but up to 10 m' since 1989. Nevertheless, so far no relation can be indicated between the groundwater level and concentration of the above discussed parameters.

Sawai Madhopur District

Average chloride and EC concentrations per block, in the Bhander Sandstone and Alluvial aquifers for the period 1984–2009 are presented in Figures 1.12-19–1.12-23 (odd figures). The graphs demonstrate clearly the close correlation between the two parameters, since the Chloride is the dominant ion. The Long-term trends of average chloride values in the three blocks fluctuate within the range of 200 – 600 mg/l, the minimal values, 200–300 mg/l in Bonli block and the highest in Bamanwas block, 200 –550 mg/l. Isolated higher pulses of up to 900 and almost 1000 mg/l are recorded in Gangapur and Bamanwas blocks, still lower than the maximum accepted for drinking (1000 mg/l). This stable quality outline throughout 26 years of continuous draft of up to 0.2 Mm^3/ km^2 and continuous water level drop, about 6–7 m' in the last decade may reflect a "safe" distance, as of now, from the saline impact of the Yamuna basin in the east.

EC trends follow very closely, almost parallel, the Chloride trends. Average levels in the three district blocks within ACZ IIIb throughout the last 21 years are rather moderate and stable, about 2000 µS/cm and even a minor drop in Bamanwas block, reflecting the Chloride outline. Some isolated high peaks that may reach almost 5000 µS/cm are displayed in the Gangapur and Bamanwas graphs.

Average NO_3 and F levels per block for the period 1984–2009 are presented in Figures 1.12-20–1.12.24 (even figures). Average NO_3 concentrations in the three relevant blocks are 100 and 150 mg/l in Bamanwas and Gangapur blocks (about the permissible limit for drinking water, 100 mg/l) and 250–200 mg/l (drop trend) in Bonli block. High isolated contamination pulses of 400 and 500 mg/l are recorded in Bonli block, most probably due to sever, although short lasting, contamination events from the surface.

Fluoride concentrations levels in the three blocks are averagely lower than the permissible limit of 1.5 mg/l. However, all three exceptionally high records of 2–3 mg/l in Gangapur and Bamanwas and 1.5 mg/l in Bonli suspiciously take place exactly in 2008, and disappear afterwards, therefore are not necessarily correct.

Dausa District

Average chloride and EC concentrations per block, in the Alluvial aquifers for the period 1993 – 2010 are presented in Figure 1.12-25. The graphs demonstrate clearly the close correlation between the two parameters, since the Chloride is the dominant ion. The Long-term trends of average chloride values in the Mahwa block (the only Dausa District block in this ACZ) fluctuate within the range of 350–550 mg/l. Isolated higher pulses of up to 650 mg/l are recorded in 2003 and 2008, still lower than the maximum accepted for drinking (1000 mg/l). This almost stable quality outline throughout 17 years of continuous draft of up to 0.1 Mm^3 per km^2 and continuous, although minor, water level drop in the last decade may reflect a "safe" distance, as of now, from the saline impact of the Yamuna basin in the east.

EC trends follow very closely, almost parallel, the Chloride trends. Average levels in this only block within ACZ IIIb throughout the last 17 years are rather moderate (see Figure 1.12-25) and almost stable, about 2000 - 3000 µS/cm reflecting the Chloride outline. An isolated high record that may reach above 4000 µS/cm is displayed in 2003.

Average NO_3 and F levels in the block for the period 1994–2010 are presented in Figure 1.12-26 (even figures). Average NO_3 concentrations in the block are decreasing from about 70 to about 20 mg/l, exceptionally low value.

Average Fluoride concentrations levels in the block are 1 mg/l, permissible limit of 1.5 mg/l. However, two higher events of above 1.5 mg/l and 2 mg/l records are encountered in the years 2000 and 2007 and disappear afterwards.

Bharatpur District

The combined consequence of accumulated water level drop, due to continuous over-exploitation and the proximity to the saline groundwater of the Yamuna basin, on the UP side of the border, is the aquifer salinity of eight out of the nine blocks in this district. The sever quality downgrading of the aquifer has not yet reached the Bayana block, which is somewhat far from the "saline front" but it will happen sooner or later, in case the present over-exploitation policy is not changed. The aquifer in all the district blocks is the Older Alluvium aquifer.

Average Chlorine and EC concentrations for the period 1984–2009 are presented in Figures 1.12-27–1.12-43 (odd Figures). The graphs demonstrate clearly the close correlation between the two parameters, since the chloride is the dominant ion in all salinity ranges. The Long-term trends of average chloride values in the blocks of Weir, Sewar, Rupbas, Nadbai and Kaman display an increase from 600 and 800 mg/l to 1000 and 1200 mg/l, and in Pahari, Deeg and Kumher block sit reaches about 1400 to 1800 mg/l. The only stable block, in respect to salinity, is Bayana block, where the average chloride is 400 mg/l all along the period of 1984 – 2010. The fluctuating outline of the average salinity values, as displayed, that may reach 400 to 1000 mg/l is typical to groundwater in close proximity to salinity source which is exactly the present case. The quality degrading process is escalating and in the blocks of Pahari and Kumher the salinity seems to be crossing the 2000 mg/l line at the end of the decade.

EC trends follow the chloride trends, not as close and parallel such as in other, less saline groundwater but with the same sharp fluctuation outline. In the weir, Rupabas, Kaman and Nadbai, average levels are either stable or slightly increasing along the 4000 µS/cm, in Pahari and Deeg the average values follow the 6000 µS/cm level, in Kumher it climbs from 6000 to 7000 µS/cm but in the Bayana block which is still out

of the impact of saline water from the east the average EC values drop, due to a reason unknown, from 2000 to 1500 µS/cm at the end of the decade.

Average NO_3 and Fluorine levels per block for the period 1984–2009 are displayed in Figures 1.12-28–1.12-44 (even Figures). In the blocks of Weir, Rupbas, Pahari, Nadbai, Kumher and Deeg the average level is along the 150 mg/l and usually slightly decreasing to 100 mg/l and below. In the Bayana block, as expected, it is lower than 50 mg/l in 1984 to somewhat lower than 100 mg/l at the end of the decade.

Behaviour of the Fluorine concentration is within and below the permissible limit, and in the Bayana block, probably reflecting the general lower salinity picture it is than 1 mg/l. In all the blocks it seems to be dropping in the last decade, due to a reason unknown.

Static water levels in all the blocks seem to have been dropped by about 2–4 m' in the last decade and 3 – 8 m' throughout the study period, most likely as a consequence of accumulated over-exploitation. It is assumed that the depletion process, which is clearly more moderate than in other ACZs, is controlled/compensated by migration of saline waters from the east, a "buffer" process, known to have been taking place in this particular area since the early Nineties at least and is reflected in the increasing salinity levels.

Alwar District

The Alwar District encompasses 14 blocks, more than in the other districts of this ACZ. The regional lithology is rather heterogeneous, not only the alluvium such as in the Bharatpur district in the east but with different Basement rocks, mainly in the south. Chemical outline of groundwater is not consistent and presents a few water types and changes. The most important one is the difference from the Bharatpur District in the west, which is drastically influenced by saline waters from the UP in the east, whereas the Alwar district, drained northwards into the state of Haryana, does not display any impact of proximity to base levels known, in other regions, to contain saline waters. In all the blocks there is a continuous trend of water level descent throughout the studied period that reach 20 m' in a few blocks, such as Reni,, Mandawar, Kishangarh Bas. Needless to say, this process encourages and boosts the groundwater quality deterioration and is likely to accelerate the downgrading of groundwater resources.

Average chlorine and EC concentrations for the period 1984–2009 are presented in Figures 1.12-45–1.12-71 (odd Figures). The graphs demonstrate clearly the correlation between the two parameters, since the chloride ion is the dominant ion in all salinity ranges. The Long-term trends of average chloride values in the blocks of Umren, Tijara (outflowing to Haryana), Thanagazi and Bansur demonstrates a stable level of slightly below 200 mg/l, with only one questionable event of 600 mg/l in 1994. In the blocks of Reni, Rajgarh, Nimrana, Mandawar, Kishangarh Bas and Behror the chloride values fluctuate along the 400 mg/l level in a stable, increasing or increasing trend, with a few higher pulses of 700 – 800 mg/l in the neighbouring blocks of Reni and Rajgarh in 2007 – 2010, probably approaching a cycle of quality deterioration. In the blocks of Ramgarh, Lachhmangarh and Kathumbar, on the boundary of the saline Bharatpur district, chloride levels are along or approaching the 600 and the 800 mg/l level, and in the Kotkasim block, on the Haryana state boundary as well. Such as is the case in the

saline sharp fluctuations that may reach 1000 mg/l and above in a few cases, in Kathumar and Lachhmangarh blocks which are on the quality deteriorating block of Pahari in the east.

EC levels follow the chloride trends very closely, almost parallel and is fluctuating along or below the 2000 µS/cm line in the low salinity blocks, 3000 µS/cm in Ramgarh and Kotkasim blocks, and about 4000 µS/cm in Lachhmangarh and Kathumar blocks.

Average NO_3 and Fluorine levels per block for the period 1984 – 2009 are displayed in Figures 1.12-46–1.12-72 (even Figures). Average NO_3 levels are within or slightly above the permissible limit of 100 mg/l in the Tijara, Thangazi, Nimrana, Kotkasim and Behror blocks and oddly decreasing to almost nil in Reni block, from 200 to about 100 mg/l in Mandawar and Lachhmangarh blocks and from 300 to 100 mg/l in Kishangarh Bas and Kathumar blocks.

Fluorine concentration roughly coincides the NO_3 behaviour. Values are following the 1 mg/l level (the permissible limit for drinking water) or decreasing below it. In the Mandawar, Lachhmangarh, Kotkasim and Kathumar the average level is 1–1.5 mg/l, in a decreasing trend too but there are some unexplainable, higher peak events of 2 – 3 mg/l, most probably a reflection of the basement country rocks.

		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
8	Gneisses(B.G.C.)	C_3S_1	High Salinity & Low Sodium

In Gneisses (B.G.C.) unit of ACZ only one class of irrigation water, high salinity and low sodium class water exists.

In Bhander sandstone, older alluvium and Quartzite units the irrigation water classes range from medium salinity and low sodium to very high salinity and very high sodium class water.

In Phyllite/schist, slate and younger alluvium aquifer units the irrigation water classes range for medium salinity and medium sodium to very high salinity and very high sodium water classes. Whereas in Alwar district limestone unit of ACZ III(b) the medium salinity and medium sodium to high salinity and medium sodium class of water exists.

It may be seen from map of classification of irrigation water of ACZ III(b) as shown in Drawing No. ACZ III(b)-009, that more than half of the area of ACZ contain good to excellent class irrigation water except central, southern and north-eastern parts of ACZ which bear variously unsuitable class irrigation water ($C_4 S_2$ to $C_4 S_4$ classes).

1.14 Groundwater Draft Village-wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ III(b). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Assessment ground water draft in ACZ III (b)

ACZ IIIb Total			2,702.76	252.86	2,955.62

Source: Village-wise data of Tehsil, CGWB and RGWD

It may be observed from the above table that total abstractions for all uses in ACZ IIIb is 2,955.62 Mm^3 which include 2,702.76 Mm^3 as agriculture draft and 252.86 Mm^3 as domestic and industrial draft.

A total of 1,331.67 Mm^3 are abstracted from Alwar district part of the ACZ which include 1,220.46 Mm^3 as agriculture draft and 111.21 Mm^3 as domestic and industrial draft. The block Tijara amounts to maximum abstraction of 149.86 Mm^3 in the district.

In Bharatpur district part of the ACZ total 502.53 Mm^3 of ground water is abstracted which include 452.40 Mm^3 as agriculture draft and 50.13 Mm^3 as domestic and industrial draft. A maximum abstraction of 75.66 Mm^3 has taken place in Weir block and minimum 18.06 Mm^3 abstraction has occurred in Kumher block. Among aquifer units maximum abstraction of 72.29 Mm^3 are obtained from older alluvium unit in Nadbai block of Bharatpur district.

In Dausa district part of the ACZ total 66.03 Mm^3 of ground water is abstracted which include 59.66 Mm^3 as agriculture draft and 6.37 Mm^3as domestic and industrial draft. Older alluvium aquifer unit in the only block (Mahuwa) of the district is having maximum abstraction of 56.29 Mm^3 in whole Dausa district.

A total of 331.34 Mm^3 are abstracted from Dhaulpur district part of the ACZ which include 300.86 Mm^3 as agriculture draft and the 30.48 Mm^3 as domestic and industrial draft. The maximum abstraction of 123.62 Mm^3 in Dhaulpur block has taken place in

district. Among aquifer units maximum abstraction of 112.25 Mm^3 are obtained from Older alluvium unit in Dhaulpur block of the district.

In Karauli district part of the ACZ total 464.05 Mm^3 of ground water is abstracted which include 429.31 Mm^3 as agriculture draft and 34.74 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Hindaun block which amount to 137.34 Mm^3 and minimum 30.65 Mm^3 abstraction has occurred in Nadoti block. Among aquifer unit maximum abstraction of 120.99 Mm^3 are obtained from older alluvium unit in Hindaun block of the district.

A total of 259.99 Mm^3 are abstracted from Sawai Madhopur district part of the ACZ which include 240.07 Mm^3 as agriculture draft and 19.92 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Gangapur block which amount to 106.37 Mm^3 and minimum 69.73 Mm^3 abstraction have occurred in Bonli block. Among aquifer units maximum abstraction of 95.29 Mm^3 obtained from Older alluvium unit in Gangapur block of the district.

1.15 Static Groundwater Resources

1.15.1 Static Ground Water Resource (Fresh Ground Water)

The fresh static ground water resources of ACZ III (b) for year 2010 are given in Table 1.15-1.

Table 1.15-1 Fresh static ground water resources of ACZ III(b)

Source: - CGWB and RGWD
Note: - Zero availability means negligible value

Of the total assessed saline static ground water resources of 525.29 Mm^3 in the ACZ, minimum of 30.14 Mm^3 are available, in Sawai Madhopur district and maximum of 327.59 Mm^3 in Bharatpur district of the ACZ. Of the blocks in ACZ, the highest assessed 98.43 Mm^3 in older alluvium aquifer unit of Pahari block of Bharatpur district.

1.16 Dynamic Ground water Resources

1.16.1 Dynamic Ground Water Resource (Fresh Ground Water)

The assessed net availability of dynamic ground water resource, ground water abstraction for all type of uses, the stage of ground water development and category of development block for ACZ for year 2010 is shown in Table 1.16-1.

ACZ IIIb Total			**1,907.60**	**2,955.62**	**154.94**	**Over Exploited**

Note: - Zero availability means negligible value

It may be seen from the table that net ground water availability in the ACZ is assessed as 1,907.60 Mm^3 and draft for all types of uses as 2,955.62 Mm^3. This works out the stage of ground water development in ACZ as 154.94% giving the zone a ground water

over-exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ III(b) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ III(b)-010.

Of the total 36 blocks of ACZ, 29 blocks in various districts covering the ACZ are categorised as ground water over exploited blocks with stage of ground water development to range from 107.43% (Baseri block, district Dhaulpur) to 288.32% (Kathumar block, district Alwar). Of the remaining blocks 6 are categorised as critical and 1 under Semi-Critical category.

1.16.2 Dynamic Ground Water Resource (Saline Ground Water)

The assessed net availability of saline dynamic ground water resource for the ACZ for year 2010 is shown in Table 1.16-2.

Table 1.16-2 Saline Dynamic Ground Water Resources (2010) of ACZ III (b)

	Block Total		**19.43**
District Total			**23.55**
ACZ IIIb Total			**292.81**

Note: - Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 292.81 Mm^3. The net ground water availability in Alwar district part of the ACZ is 43.87 Mm^3 while that of Bharatpur district is 169.50 Mm^3. The net ground water availability in Karauli district is 55.90 Mm^3 and that in Sawai Madhopur district is 23.55 Mm^3. The maximum net ground water availability is 45.81 Mm^3 in Sapotra block of Karauli district.

1.17 Assessment of Groundwater Availability

The net dynamic fresh ground water availability at year 2010 in ACZ III(b) is 1,907.60 Mm^3 and ground water draft 2,955.62 Mm^3. The stage of ground water development in zone is 154.94% and is categorised as over-exploited zone. Saline ground water resource of the zone is assessed at 292.81 Mm^3.

The total static ground water resource in ACZ is assessed at 3,021.19 Mm^3, out of which 525.79 Mm^3 is saline ground water.

1. Groundwater Study of Agroclimatic Zone IV (a)

1.1 General

The ACZ covers an area of 37563.35 km^2 and comprises the districts of Ajmer, Bhilwara, Sirohi, Rajsamand, Udaipur, Chittaurgarh and Pratapgarh. The average annual rainfall in zone is 615.5 mm and mean annual evaporation 197.9 mm.

1.2 Geology

The entire ACZ IV (a) comprises Pre-cambrian Quartzite, Phyllite, Schist, Gneiss and Carbonate rocks that constitute the Aravali hill range.

1.3 Hydrogeology

The hydrogeological map of ACZ IV (a) is given in Drawing No. ACZ IV(a)-001. The description of water bearing formation is given as follows.

Bhander Sandstone

This unit is part of the Vindhyan Super Group and comprises interbedded shales and sandstones. In this formation primary and secondary porosity controls occurrence and availability of groundwater. Average aquifer depth ranges from 60 to 136 m amsl average static water from 5.50 m bgl to 52.50 m bgl. The average discharge of tubewells have a range from 0.19 lps to 3.78 lps.

Limestone

Limestone has a limited occurrence around Nimbahera, Chittaurgarh and Begun blocks of Chittaurgarh district only. The sandstone is fine-grained, with alternating bands of variegated shales of red, yellow, buff and grey colour. It is hard and compact and sparsely jointed. Sandstone and shales occur around Bijolia block of Bhilwara district and around Begun Bhainsoraigarh and Nimbahera blocks of Chittaurgarh district. The formation is dominated by predominantly horizontal joints and is of low groundwater exploitation potential. Groundwater in the formation occurs under phreatic conditions. Well yields range from 0.46 to 0.69 lps. In Udaipur District near Kanpur village, which is about 8 km on Jhamar Kotra road, a number of tube-wells were drilled in the cavernous limestone for drinking water supply to Udaipur city. Well yields are very high, the range from 7.72 to 11.58 lps, with negligible drawdown.

Deccan Traps (Basalt)

The basalt is dark-grey, olive-green to green, compact, vesicular and amygdaloidal. It is usually weathered, and was formed during the upper Cretaceous to Lower Eocene age. The formation is well jointed with typical columnar joints. The unit is found in the southern part of Chottisadari, Arnod and Pratapgarh blocks of Pratapgarh district. The basalt aquifer has a very low water yielding capacity. Groundwater in the Basalt occurs under phreatic condition. Well discharge ranges from 0.07 to 2.31 lps in compact and vesicular Basalt, and 0.03 to 2.89 lps in weathered Basalt.

Gneisses

The gneisses belong to Delhi Super Group. These are hard, compact, fine to medium grained, characterized by alternating bands of light and dark-coloured ferro-magnesium minerals. The formation is fractured, with joints occurring in a small area around Gogunda block of Udaipur district and around Railmagra block and western periphery of Rajsamand district. The average SWL is 8.21 m bgl and average aquifer depth as 79.21 m. Also the average tubewell discharge is 3.87 lps and well specific capacity 6.42 lps/m of drawdown. This formation also has low groundwater exploitation potential.

Phyllite and Schist

The rock unit belong to the Aravalli Super Group, representing argillaceous sediments of varying grades of metamorphism, from slate and phyllite to mica-schist. The units are soft and friable, varying in texture and mineralogical composition - from fine to medium-grained. The phyllites and schists are jointed, fractured and foliated.

This hydrogeological formation covers the following wide areas: (a) the central and eastern parts of the Bhilwara District around Mandargarh, Shahpura, Jahazpur and Mandal blocks (b) Dungla, Rashmi, Bhopal Sagar blocks of Chittaurgarh district (c) Khamnor block of Rajsamand district (d) large areas in the western part of Udaipur district. In these formations groundwater occurs under unconfined conditions. The yield of wells in phyllite and schist ranges from 0.35 to 0.52 lps.

Erinpura Granite

This lithological unit comprises prophyritic and non-porphyriticgranitic rock associated with aplite, and augen-gneiss. It is grey to dark-coloured, medium to coarse-grained and occupy a major part of this Zone. The rocks are massive, hard, compact, jointed and fractured. This formation is of low groundwater exploitation potential. The yield of wells tapping the formation ranges from 0.35 to 0.58 lps.

Gneiesses (B.G.C.) and Gneiesses

The banded gneiss complex aquifer unit is exposed in parts of Bhilwara, Chittaurgarh and Rajsamand districts of ACZ. The static water level (bgl) of aquifer unit in Bhilwara Udaipur area has a range of 4.99 m to 16.17 m. The yield of the tube wells in this area ranges from 0.33 to 5.25 lps for a drawdown of 40.00 to 41.60 m. In Chittaurgarh part of the ACZ the static water level (bgl) in this unit have a range from 0.43 to 43 m, whereas yield of the tubewells ranges from 3.30 to 8.08 lps for a drawdown of 19.16 m to 34.00m. In Rajsamand district part of the ACZ however, the static water level (bgl) of aquifer unit ranges from 1.00m to 13.25 m and the yield of the tubewells ranges from 0.25 m to 10 lps for a drawdown of 8.66 m to 49.84 m.

Shale

This aquifer unit have limited extent in part of Chittaurgarh and Pratapgarh districts of ACZ. The static water level (bgl) of the aquifer unit ranges from 5.53 m to 9.90 m. The yield of the tubewells tapping the unit ranges from 0.67 lps to 5 lps.

1.4 Main Aquifers units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 8 of Annex 2(b).

From the above table it may be observed that explored aquifer depth of Older alluvium aquifer unit in ACZ IV a ranges from 16.50 m (Village Phulia, block Shahpura, district Bhilwara) to 200 m (village Rampura, block Shahpura, District Bhilwara); SWL (bgl) from 2.28m (village Phulia, block Shahpura, district Bhilwara) to 22.90 m (Village Dodhla, block Shahpura, district Bhilwara) and well discharge form 1 lps (village and block Jahajpura, district Bhilwara) to 31.20 lps (village Phulia, block Shahpura, district Bhilwara).

In sedimentary aquifers the explored depth ranges from 14 m (village Jalindri, block Mandalgarh, district Bhilwara) to 315 m (village Bigod, block Mandalgarh, district Bhilwara); SWL (bgl) from 1.40 m (Village Parsoli, block Begun, district Chittaurgarh) to 90 m (village Jashma, block Bhainsorgarh, district Chittaurgarh) and well discharge from 0.03 lps (village Antali, block Mandalgarh, district Bhilwara) to 20.38 lps (village Jalindri. Block Mandalgarh, district Bhilwara).

The explored depth in hard rock aquifer ranges from 8 m (village Nathdwara block Railmagra, district Rajsamand); SWL (bgl) from 0.20 m (village Jharol, block Bargaon, district Udaipur) to 60m (village Pharara, block Khamnor, district Rajsamand) and well discharge from 0.03 lps (village Surkhandkhera, block Sarada, district Udaipur) to 25.20 lps (village Vallabhnagar, block Girwa, district Udaipur).

1.6 Sub-surface Geology

Hydrogeological Cross–section A-A' (Sayra–Semari)

The cross–section A-A' (Figure 1.6-1 and Figure 1.6.2) has been drawn from Sayra village in North–West to Semari village in south–east in western part of the Agroclimatic zone. Total length of the cross–section is 139 Kms. The ground elevation ranges from RL 248 meters (Semari) to RL 902 meters (Sayra) above mean sea level. The cross–section reveals that thickness of alluvium of Quaternary age is almost nil throughout the cross–sectional area. It is depicted from the cross – section that north–western part of the cross - sectional area is occupied by Phyllite/Schist and Gneisses of Delhi Super Group while south–eastern part of the cross–sectional area is occupied by Gneisses and Phyllite/Schist of Aravali and Pre- Aravali Group.

The ground water levels in the area ranges from 13 meters below ground level (Semari) to 40 meters below ground level (Rawalia Khurd).

Hydrogeological cross – section B-B' (Dungla- Parasoli)

The cross –section B-B' (Figure 1.6-3) has been drawn from Parasoli village in the north–east to Dungla village in the south–west in eastern part of the Agroclimatic zone. Total length of the cross–section is 108 kms. The ground elevation ranges from RL 402 meters (Chittaurgarh) to RL 489 meters (Parasoli) above mean sea level. The cross – section reveals that thickness of alluvium of Quaternary age is just 2 to 6 meters below ground level. Limestone and Shale of Vindhyan Super Group are occupying the major part of the cross–sectional area. In south - western part, Gneisses of Pre-Aravali age are encountered. A fault seems to be existing between Dungala and Kanoj which has displaced the Gneisses of Pre-Aravali age and Shales of Vindhyan Super Group.

The ground water levels in the area ranges from 14 meters below ground level (Dungla) to 34 meters below ground level (Chittaurgarh).

1.7 Depth to Groundwater

The depth to ground water table map pre-monsoon (2010) of the ACZ IV (a) is placed at Drawing No. ACZ IV(a)-003. Generally, the depth to ground water in this period in ACZ ranged from 5 to 10m (bgl). The central part, however, was occupied with relatively deeper levels of 20 to 40m (bgl).

The post-monsoon ground water level map (2010) of the zone is at (Drawing No. ACZ IV(a)-004). The map when compared with pre-monsoon revealed rise in levels as could be seen from the large coverage of shallow ground water depth zones of less than 2m (bgl) and 2 to 5 m (bgl) especially in western and eastern parts of ACZ where in pre-monsoon season of 2010 such a situation was no-existent.

1.8 Ground water Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ IV (a) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-wise/Aquifer-wise fluctuation in levels of ground water (2010) ACZ IV(a)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)

ACZ IVa Summary			**698**	**-6.10**	**10.76**	**5.44**

Source: CGWB and RGWD

The above table depicts that average ground water level fluctuation in the ACZ in sedimentary aquifers ranges from 2.83 m (Limestone) in Girwa block of Udaipur districts to 10.50 m (Limestone) in Mandalgarh block of Bhilwara district. In hard-rock aquifers the average ground water level fluctuation ranges from 1.80 m (B.G.C.) in Pratapgarh block of Pratapgarh district to 10.42 m (B.G.C.) in Bargaon block of Udaipur district.

1.9 Ground water Levels and Flow Directions

The central and major part of this ACZ, which lies and extends on the south east flank of the Aravallies and south eastwards, belongs to the Banas River Basin. The southern part is the northern margin of the Mahi River Basin, the Aravallies margins in the west and south west constitute the Sabarmati and West Banas River Basins and some narrow portions of the Luni and Sukli River Basins, and the margins in the east belong to the western part of the huge Chambal River Basin. A significant, dominant portion of this

ACZ is, therefore, the western Aravallies foothills and the hydrogeological boundaries of the constituted river basins.

The outline and pattern of the water level contours throughout most of the ACZ area are the unequivocal demonstration of the rough, mountainous terrain, with steep gradients that reach 20–40m per km on the highest Aravalies flanks. Downstream, towards the valley shaped by the Banas River and its tributaries, the gradient becomes more moderate, 5–6m per km and lower, and the contours converge towards and along the main channel of the Banas River, flowing north-eastwards. This outline of "topographic water level contours" is completely different from the contour configuration west of the Aravallies, which has been developed regardless the topography. The clear significance is, on its face value, remarkable hydraulic properties of the operative aquifers there (Map ACZ IVa-002).

The operative aquifers in this delineated ACZ area are the Deccan Traps in the south, the Bhander Sandstone and Limestone and Shale in the east, Phyllite & Schist in the center and south and, most dominantly, Gneisses (B.G.C.). The country rocks where the hydraulic gradients become very moderate (Drawing No. ACZ IV(a)-002), according the available geological maps are mainly the Gneisses (B.G.C.) and Phyllite & Schist (and not alluvial formations).

Groundwater level depth all throughout the ACZ area does not exceed 20 – 30m bgl, between 10m and 20m bgl in most of the area and less than 10m bgl in a few locations, such as in the Shahpura block, on an area of dense Banas upstream channels (Map ACZ IVa-003). This outline is virtually reflecting the topography, and along with the unfavourably lithology may support assumption that the operative aquifers are in fact the uppermost weathered mantle of formations that are mainly impervious to semi impervious, such as Phyllite & Schist and Shale, and not representing the full bulk of the formations. This outline may also explain the base flow, although mainly in upstream channels and the fact that unlike west of the Aravallies, most of the precipitation is being lost as surface drainage.

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ IV(a) are shown in Figure 1.10-1 to 1.10-44. The supportive data for the same is given in Annex 9.

1.10.1 Ajmer District

All the blocks of Ajmer District are mainly located in ACZ III(a). Jawaja is the only block that is located (partially) in ACZ IV(a). Groundwater level in Jawaja Block ranges between 470.98 in 1984 and 463.02 in 2010 (Pre-Monsoon; Table 1.10-1).

1.10.2 Udaipur District

The pre-monsoon average groundwater levels in Udaipur district in the year 1984 vary between a minimum of 301.73 m amsl (Sarada block) and maximum of 821.74 m amsl (Gogunda block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 299.07 m amsl (Sarada block) and a maximum of 819.96 m amsl (Gogunda block). Long-term ground water levels in each block are presented in Figure 1.10-1 to 1.10-10. The level change rates are given in Table 1.10-1.

In various block of the district the rate of change in pre-monsoon levels range from +0.01 m/yr in Kotra Block to -0.14 m/yr in Bargaon Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Bhindar block where average groundwater levels are predicted to reach 457.75 m amsl by the year 2060, ~6.5 m below current stages. As a result, 79% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.3 Sirohi District

The pre-monsoon average groundwater levels in Sirohi district in the year 1984 vary between a minimum of 365.94 m amsl (Pindwara block) and maximum of 482.63 m amsl (Abu Road block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 360.28 m amsl (Pindwara block) and a maximum of 478.14 m amsl (Abu Road block). Long-term ground water levels in each block are presented in Figure 1.10-11 to 1.10-12. The level change rates are given in Table 1.10-1.

In various blocks of the district, the rate of decline in levels of ground water ranges from -0.17 m/yr in Abu road block to -0.21 m/yr in Pindwara block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, by the year 2060 more than half of the monitoring wells will be dry in both blocks.

1.10.4 Rajsamand District

The pre-monsoon average groundwater levels in Rajsamand district in the year 1984 vary between a minimum of 482.48 m amsl (Railmagra block) and maximum of 778.3 m amsl (Kumbhalgarh block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 474.43 m amsl (Railmagra block) and a maximum of 777.41 m amsl (Kumbhalgarh block). Long-term ground water levels in each block are presented in Figure 1.10-13 to 1.10-19. The level change rates are given in Table 1.10-1.

In various blocks of the district, the rate of decline in levels of ground water ranges from -0.04 m/yr in Khamnor Block to -0.20 m/yr in Railmagra Block. The rate ranges for post-monsoon period in various Blocks of the district, from –0.01 m/yr in Kumbhalgarh Block to -0.09 m/yr in Railmagara and Amet Blocks.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Bhim, Deogarh and Khamnor blocks where 70%-71% of the monitoring wells will be dry.

1.10.5 Pratapgarh District

The pre-monsoon average groundwater levels in Pratapgarh district in the year 1984 vary between a minimum of 419.63 m amsl (Pratapgarh block) and maximum of 435.63 m amsl (Choti Sadri block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 419.34 m amsl (Pratapgarh block) and a maximum of 426.00 m amsl (Choti Sadri block). Long-term ground water levels in each block are presented in Figure 1.10-20 to 1.10-21. The level change rates are given in Table 1.10-1

The rate of change in pre-monsoon period ranges from +0.01 m/yr in Pratapgarh Block to -0.37 m/yr in Choti Sadri Block. In post-monsoon period the rate of decline ranges from -0.1 m/yr in Pratapgarh Block to -0.29 m/yr in Choti Sadri Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Pratapgarh block where average groundwater levels are predicted to reach 407.58m amsl by the year 2060, ~12m below current stages. As a result, 73% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.6 Chittaurgarh District

The pre-monsoon average groundwater levels in Chittaurgarh district in the year 1984 vary between a minimum of 409.87 m amsl (Bhainsorgarh block) and maximum of 466.39 m amsl (Badi Sadri block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 371.59 m amsl (Bhainsorgarh block) and a maximum of 458.26 m amsl (Nimbahera block). Long-term ground water levels in each block are presented in Figure 1.10-22 to 1.10-32. The level change rates are given in Table 1.10-1.

In various blocks of Chittaurgarh district, the rate of Change in pre-monsoon period ranges from -0.06 m/yr in Begun block to -0.80 m/yr in Bhadesar block. In post-monsoon period the rate of decline ranges from -0.04 m/yr in Begun block to -0.80 m/yr in Bhadesar block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the

average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Kapasan Block where average groundwater levels are predicted to reach 416.77 m amsl by the year 2060, ~10 m below current stages. As a result, 94% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.7 Bhilwara District

The pre-monsoon average groundwater levels in Bhilwara district in the year 1984 vary between a minimum of 354.94 m amsl (Jahajpur block) and maximum of 502.66 m amsl (Raipur block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 339.56 m amsl (Jahajpur block) and a maximum of 501.38 m amsl (Raipur block). Long-term ground water levels in each block are presented in Figure 1.10-33 to 1.10-43. The level change rates are given in Table 1.10-1.

In various blocks of Bhilwara district, the rate of change in pre-monsoon period ranges from -0.06 m/yr in Mandal block to -0.22 m/yr in Hurda block. In post-monsoon period the rate of decline range from -0.07 m/yr in Raipur Block to -0.22 m/yr in Hurda Block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Banera block where average groundwater levels are predicted to reach 389.99 m amsl by the year 2060, ~9 m below current stages. As a result, 90% of the monitoring wells (CGWB & RGWD) in the block will dry up.

Table 1.10-1 Long-term Groundwater Levels Change Rates– ACZ IV (a) 1984-2010

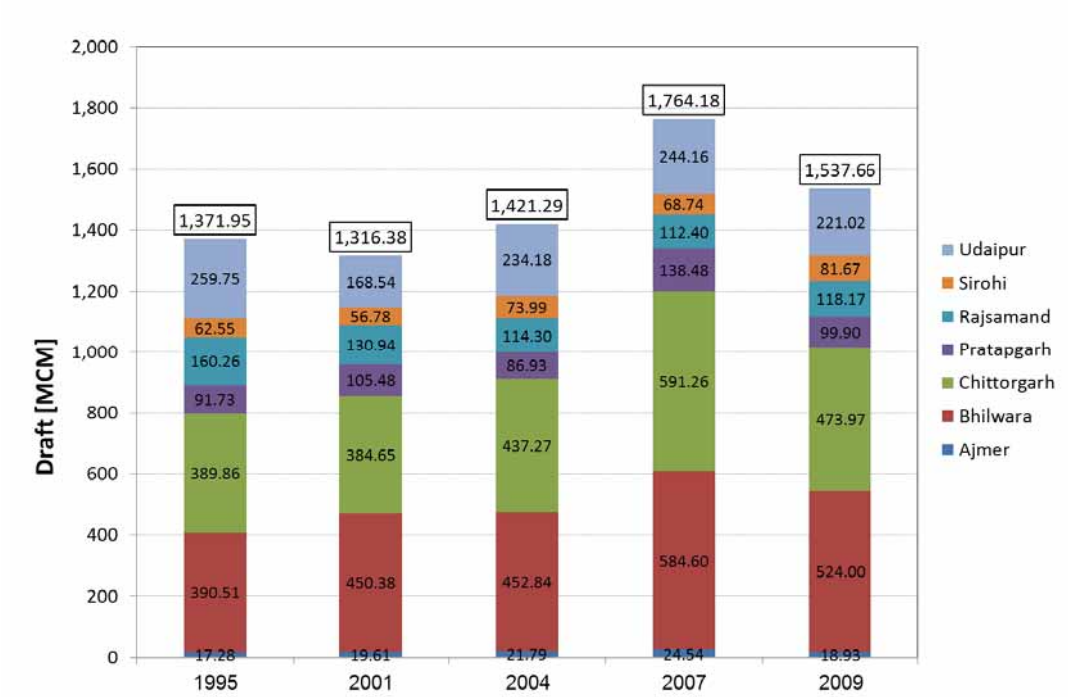
1.11 Long-term drafts

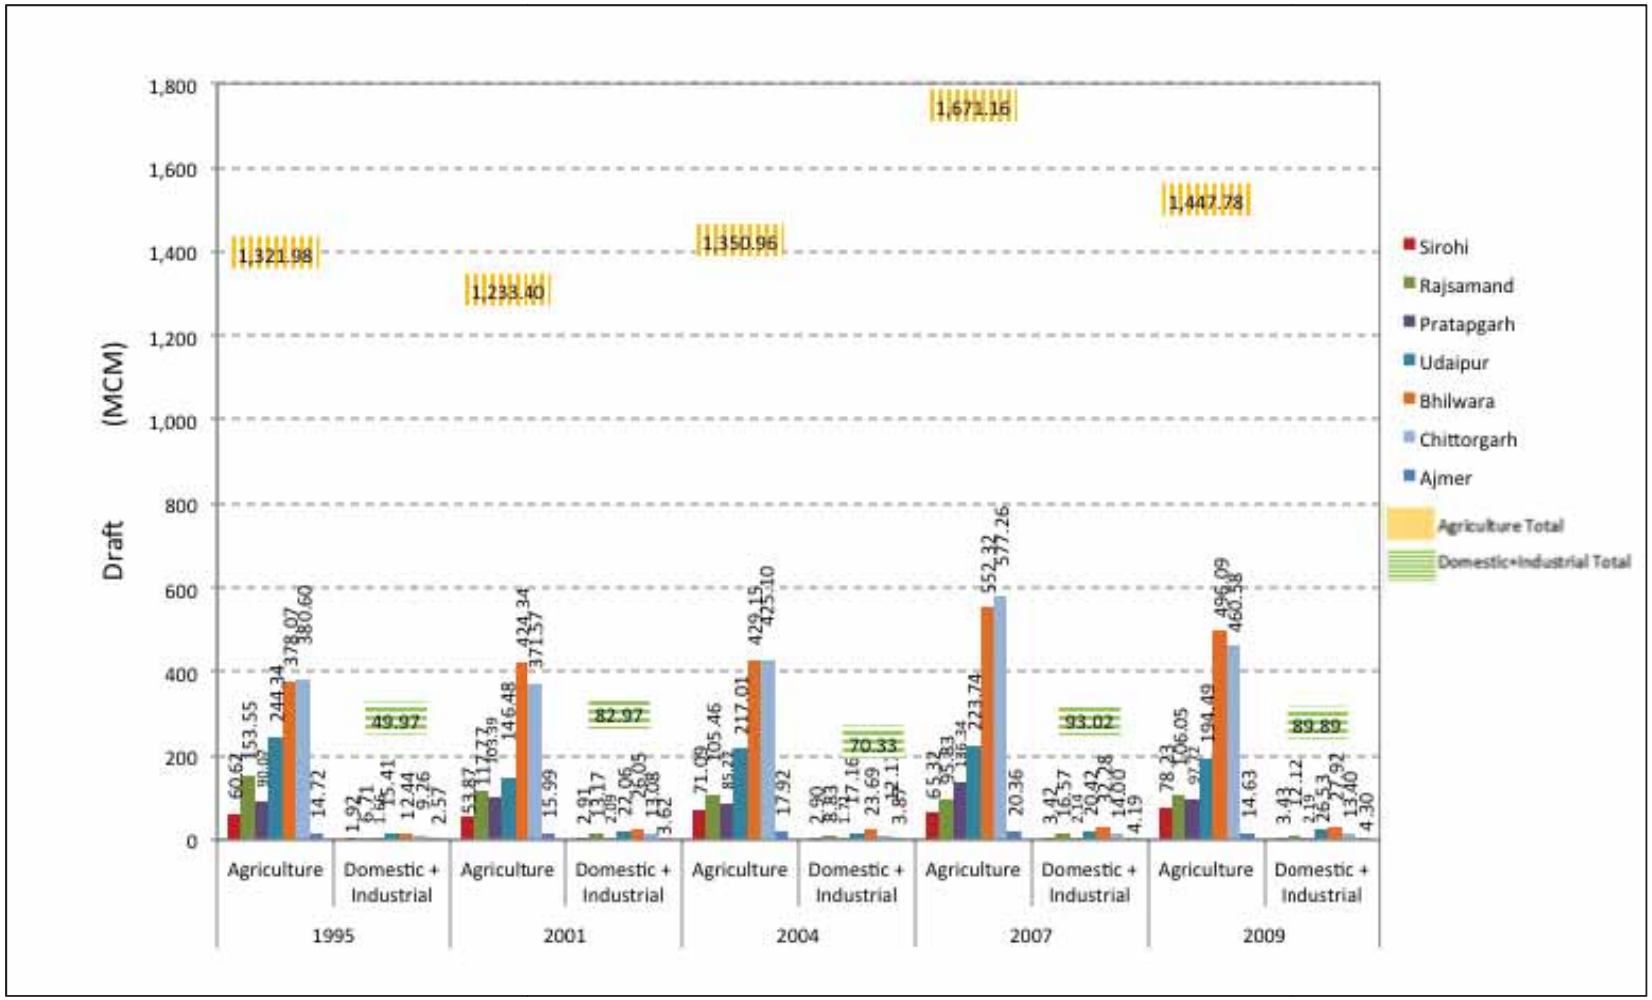
Block wise groundwater draft in ACZ IV(a) for agriculture, domestic and industrial uses is shown in Figures 1.11-8. Figure 1.11-1 presents long-term draft for the years (1995, 2001, 2004, 2007 and 2009). Total draft in ACZ IV (a) remained close to stable from 1995 to 2004 around ~1,300-1,420 Mm^3. Between 2004 and 2007 a sharp increase took place from 1,421 Mm^3 to 1,764 Mm^3 (+24%). Between 2007 and 2009 total draft in the ACZ dropped back down to 1,538 Mm^3. The relative increase of the entire period (1995-2009) was 12%. The main increase took place in Bhilwara (34%) and Sirohi (31%) districts, while significant decrease was recorded in the districts of Rajsamand (-26%) and Udaipur (-15%; Figure 1.11-1). Figure 1.11-2 presents long-term drafts according to the type of usage. The graph shows that increase in drafts took place both in agriculture and domestic-industry sectors, although the relative increase of domestic-industry sector is considerably higher. Groundwater agriculture draft increased between 1995 and 2009 from 1,322 to 1,448 (+10%) while domestic and industrial usages rose from 50 to 90 Mm^3 (80%; Table 1.11-8). In addition, Figure 1.11-1 and table 1.11-8 show that the main consumption in the ACZ is in Chittaurgarh and Bhilwara districts that exceeded 500 Mm^3 in 2007, while in Ajmer district production remained below 25 Mm^3. Draft per area ratio varies along the ACZ, in the east around Chittaurgarh districts draft volumes are high and reach values >0.1 Mm^3/km^2 while in the western part, around Rajsamand district the draft volumes are usually below 0.04 Mm^3/ km^2 (Figure 8.8).

Figure 1.11-1 Total Groundwater Abstraction in ACZ IVa by Districts (1995-2009)



Source: CGWB and RGWD

Figure 1.11-2 Groundwater Draft for Agriculture and Other Uses in ACZ IVa by Districts



Source: CGWB and RGWD

1.11.1 Chittaurgarh District

Groundwater draft in this district was 474 Mm^3 during 2009 which comprises ~31% of the total draft in the ACZ. Groundwater draft increased from 390 Mm^3 in 1995 to a peak of 591 Mm^3 in 2007 (Figure 1.11-3). Relative rise of between 1995 and 2009 was 22%. As shown in Figure 1.11-3 the main increase was recorded during the years 2004 to 2007. In 2009 most blocks present similar volumes of abstractions ranging between 20 and 50 Mm^3 except of the blocks Nimbahera and Chittaurgarh that reach more than 70 Mm^3. Bhainsrorgarh block displayed the highest relative increase rate for the entire period, >86% in 15 years (Table 1.11-1). Draft increase at the blocks of Bhadesar, Gangrar and Nimbahera are high also and stand above 40%. In contrast Chittaurgarh block recorded a decline of -9%. Consumption increase of the domestic sector is 45% - more than twice higher than the growth of the agricultural sector (21%), this pattern is typical to all blocks in the ACZ. Still the pumping volume of domestic-industrial sector is negligible compared to the total draft and stand at average of 3% in 2009 (Table 1.11-8). Draft per area ratio is the highest in the ACZ and range between 0.05 Mm^3/km^2 in the west and north parts of the district to >0.1 Mm^3/Km^2 near to Chittaurgarh city (Figure 8.8).

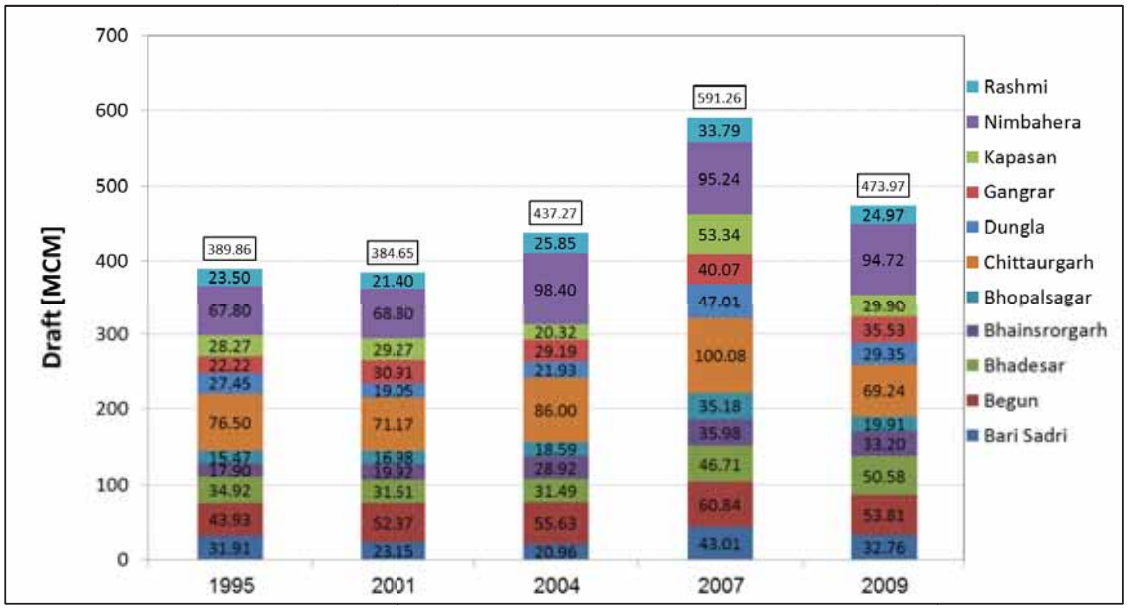
Table 1.11-1 Total Change in Groundwater Draft in Chittaurgarh District 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bari Sadri	+2%	+54%	+3%
Begun	+23%	+12%	+22%
Bhadesar	+46%	+0%	+45%
Bhainsrorgarh*	+85%	+>500%	+86%
Bhopalsagar	+29%	+17%	+29%
Chittaurgarh	-12%	+48%	-9%
Dungla	+6%	+51%	+7%
Gangrar	+60%	+56%	+60%
Kapasan	+4%	+141%	+6%
Nimbahera	+40%	+39%	+40%
District Total	**+5%**	**+78%**	**+22%**

*During 1995 there was almost no agricultural draft

Source: CGWB and RGWD; Supportive data is located in Table 1.11-8

Figure 1.11-3 Total Groundwater Draft in Chittaurgarh District (within ACZ IVa)



Source: CGWB and RGWD

1.11.2 Pratapgarh District

Groundwater draft in this district reached almost 100 Mm^3 during 2009 which comprise ~6% of the total draft in the ACZ. Between 1995-2007 groundwater draft increased by 51%, from 91 Mm^3 in 1995 to peak of 138 Mm^3 in 2007. Draft volumes are almost similar in both blocks Pratapgarh and Chhoti Sadri - 58 and 42 Mm^3 (2009) respectively (Figure 1.11-4, Table 1.11-8). In table 1.11-2 (presenting draft changes between the years 1995-2009) it can be seen that Chhoti Sadri block recorded a drop of 15% in the agriculture sector and a decline of -28% at the domestic-industrial sector. Consumption of domestic-industrial sector is 1% to 3% only from the total in both blocks (2009). Draft per area ratio is average to high compared to the whole state and stands on 0.04-0.06 Mm^3/Km^2 (Figure 8.8).

Pratapgarh	+36%	+90%	+37%
District Total	**+8%**	**+32%**	**+9%**

Source: CGWB and RGWD; Supportive data is located in Table 1.11-8

1.11.3 Rajsamand District

Total draft in Rajsamand District presents an unusual trend, showing a consistent decrease of groundwater abstractions during the last 15 years. Total draft decreased from 160 Mm^3 in 1995 to 118 Mm^3 in 2009, a total decrease of 42 Mm^3 (Figure 1.11-5, Table 1.11-3). Figure 1.11-5 presents the long-term draft for available years (1995, 2001, 2004, 2007 and 2009). The main decrease took place between 1995 and 2001 at all the blocks except for Kumbhalgarh block that recorded a growth of 21% (Table 1.11-3). As shown in Table 1.11-3, the decrease in the total draft is primarily due to a decrease in the abstractions for irrigation while the domestic–industrial sector registered a prominent rise during the period under review. Average component of domestic-industrial consumption stands on 10% (2009) while in most blocks (except Rajsamand, 19%) the percentage doesn't exceed 15% (table 1.11-8). Draft per area ratio is low through all the blocks and stands on 0.03 Mm^3/Km^2 (figure 8.8).

Source: CGWB and RGWD; Supportive data is located in Table 1.11-8

1.11.4 Sirohi District

Groundwater draft in this district during 2009 was 82 Mm^3 which comprises ~5% of the total draft in the ACZ. Groundwater draft increased from 63 Mm^3 in 1995 to 82 Mm^3 in 2009, a relative increase of 30% (table 1.11-4). Total agriculture consumption increase at values of 7.3 Mm^3 and 10.3 Mm^3 in Abu Road and Pindwara blocks respectively. Although the absolute growth of the agricultural sector is similar in both blocks relative increase in Abu Road block is higher and stands at over 40% (Table 1.11-4). Also in the domestic-industrial sector total change is similar with increase of ~ 0.75 Mm^3 in both blocks. Relative increases in Pindwara block is higher and stand on 103% (2009) compared to an increase of 63% in Abu Road. Component of domestic-industrial consumption stands at 7% (2009) at Abu Road and 3% in Pindwara (table 1.11-8). Draft per area ratio is low at both blocks and stand on 0.03 Mm^3/Km^2 (Figure 8.8).

1.11.5 Udaipur District

Groundwater draft in this district during 2009 was 221 Mm^3 which comprises ~14% of the total draft in the ACZ. Figure 1.11-7 presents long-term draft for available years (1995, 2001, 2004, 2007 and 2009). Groundwater draft decreased from 260 Mm^3 in 1995 to 169 Mm^3 in 2001, and later increased back again to 244 Mm^3 in 2007. From 2007 to 2009 draft remained almost stable with a minor decline. Domestic-industrial consumption shown rise in the examined period at all the blocks except for Girwa block that keeps stable. As shown in Table 1.11-5 these rises reach, at many blocks over 100%. In contrast consumption change of agriculture sector varied between the blocks. Bargaon, Bhindar, Girwa and Mavli recorded decrease of above 20% while Kherwara, Rishabhdeo and Kotra recorded increase of above 40%. Draft per area ratio is low and stand at 0.03 Mm^3/Km^2 (Figure 8.8).

Source: CGWB and RGWD; Supportive data is located in Table 1.11-8

1.11.6 Bhilwara District

Groundwater draft in this district during 2009 was 524 Mm^3 which comprises ~34% of the total draft in the ACZ. Groundwater draft increased from 391 Mm^3 in 1995 to peak of 585 Mm^3 in 2007. Relative increase between 1995 and 2009 stand on 34%. As shown in Figure 1.11-8 main increase took place between the years 2004 to 2007. All blocks present similar volumes of abstractions ranging between 20 and 60 Mm^3 except the block Mandalgarh presenting more than 90 Mm^3 in 2009. Mandalgarh block displays also the highest increase rate for the entire period, reaching 99% in 15 years (Table 1.11-6). Draft increase at the blocks of Asind, Raipur, Shahpura and Sahara are

high also and stand at above 40%. In contrast at Mandal block recorded a decline of -11%. Consumption increase of the domestic sector is 124%, significantly higher than the growth in the agricultural sector (31%). This pattern is typical to all the blocks in the ACZ (Table 1.11-8). Draft volume of domestic-industrial sector is still negligible compared to the overall (between 3% to 8% in 2009, see table 1.11-8). Values of draft per area ratio are high especially in the eastern part of the district and reach 0.06 Mm^3/Km^2 in Bhilwara city (Figure 8.8).

1.11.7 Ajmer District

ACZ IVa includes an area of ~452 Km^2 within Jawaja block which belongs to Ajmer district. Groundwater draft in this area during 2009 was 19 Mm^3 which comprises about ~1% of the total draft in the ACZ. Groundwater draft increased only slightly from 17 Mm^3 in 1995 to peak of 25 Mm^3 in 2007. Relative increase between 1995 and 2009 stranded on 10%. Consumption increase of the domestic sector is 68% while agricultural intake is stable with a minor decline of -1% (Table 1.11-7). Draft volume of domestic-industrial sector is significant compared to total (23% in 2009, see table 1.11-8). Values of draft per area ratio are low and reach 0.03 Mm^3/Km^2 (Figure 8.8).

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 7051 villages in ACZ IV(a), approximately 4978 are found suitable for drinking water use, 6040 for irrigation use and 6903 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in ground water is summarised in Table 1.12-1.

Table 1.12-1 Village and block wise water quality

Source: CGWB and RGWD

It may be seen from above that out of 7051 villages of ACZ IVa, 4701 fall under desirable, 2138 under maximum permissible limit and 212 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 4458 while number of villages with maximum permissible limit of use is 1322 and number of above maximum permissible limit for Fluoride is 1271. As regards presence of nitrate in ground water, 4367 fall under highest desirable limit of less than 45 mg/l and 1744 under maximum permissible limit along with 940 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 4558 villages fall under maximum permissible limit and 1011 under above maximum permissible limit of 2250 microhos/cm and 1482 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

i) Ground Water Quality of ACZ IV (a) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ IV(a) is shown in Drawing No. ACZ IV(a)-005. Mostly fresh ground water with chloride level zone of less than 250 mg/l to 1000 mg/l occur in most parts of Ajmer, Bhilwara, Chittorgarh, Pratapgarh, Rajsamand, Sirohi and Udaipur districts. The area with high chloride concentration, beyond 1000 mg/l, is limited and is occupied in north-eastern portion of the ACZ in parts of Bhilwara district.

Block-wise/aquifer wise percent area occupied with various levels of chloride in ground water of the ACZ, is given in the Table 1.12-2.

Table 1.12-2 Percent area occupied with various level of Chloride in ground water of ACZ IV(a)

ACZ IVa Summary			**66.28**	**30.08**	**3.64**

Source: CGWB and RGWD

It can be seen from the table that 66% area of the ACZ is covered with potable quality of groundwater of <250 mg/l chloride concentration in various aquifer units of the ACZ. It is depicted from the table that 100% area of Gneisses aquifer unit in Jawaja block of Ajmer district; Bhander sandstone, Limestone and shale aquifer units of Mandalgarh block of Bhilwara district; Limestone and Shale aquifer units of Bari Sadri block of Chittaurgarh district; Limestone, Phyllite/Schist and Shale aquifer units of Chittaurgarh block of Chittaurgarh district; Shale aquifer unit of Gangrar block of Chittaurgarh district; Bhander sandstone, Gneisses, Limestone, and Shale aquifer units of Nimbahera block of Chittaurgarh district; Basalt and Limestone aquifer units of Choti Sadri block of Pratapgarh district; Gneisses aquifer unit of Deogarh block of Rajsamand district; Erinpura Granite aquifer unit of Kumbhalgarh block of Rajsamand district; Erinpura Granite aquifer unit of Gogunda block of Udaipur district; Phyllite and Schist aquifer unit of Kherwara block of Udaipur district; Erinpura Granite, Gneisses and Quartzite aquifer units of Kotra block of Udaipur district cover 100% area comprising low chloride level ground water with less than 250 mg/l chloride concentration.

ii) Ground Water Quality of ACZ IV (a) by Nitrate

The distribution of Nitrate in ground water (Pre-monsoon 2010) of ACZ IV(a) is shown in Drawing No. ACZ IV(a)-006. It may be seen that high nitrate level ground water of

>100 mg/l NO_3 concentration occur as isolated pockets in most part of the ACZ excepting in its eastern and southern part occupied with sandstone, shale and basalt rock units. Elsewhere, the ground water bears low NO_3 concentration of less than 45 mg/l and 100 mg/l.

Block-wise/aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

ACZ IVa Summary			**62.19**	**25.12**	**12.69**

Source: CGWB and RGWD

From the above table, it may be seen that only 9% of the area of Alwar comprising ACZ have potable ground water. The percent area of fresh ground water ranges from 57.8% in Udaipur district to 65% in Sirohi district in ACZ. The area of >100 mg/l NO_3 concentration covers only Older alluvium unit in Jahajpur block of Bhilwara District.

iii) Ground Water Quality of ACZ IV (a) by Fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ IV(a) is shown in Drawing No. ACZ IV(a)-007. It may be seen from the map that a large part of ACZ in its northern and central parts in districts of Bhilwara, Rajsamand and Chittaurgarh is occupied with non-potable quality ground water with fluoride level exceeding 1.5 mg/l. Most areas in southern, eastern and western parts of ACZ covered with different aquifer units in Pratapgarh, Chittaurgarh, Udaipur districts and parts of Sirohi district bear potable quality ground water.

Block-wise / aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

Table 1.12-4 Percent areas occupied with various level of Fluoride in ground water of ACZ IV (a)

ACZ IVa Summary			**60.69**	**19.44**	**19.87**

Source: CGWB and RGWD

It is revealed from the table that about 80% area of the ACZ is covered with Fluoride content less than 1.5 mg/l. Only 20% area is occupied with high level Fluoride in ground water covering 100% area in Older alluvium aquifer unit in Shahpura block and about 95% area of Older alluvium aquifer unit in Jahajpur block of Bhilwara district.

iv) Ground Water Quality of ACZ IV (a) by EC

The distribution of EC in ground water (pre-monsoon-2010) of ACZ IV(a) is shown in Drawing No. ACZ IV(a)-008. From the map it can be seen that mostly the ACZ is occupied with low salinity ground water with EC range of <750 to 2250 micromhos/cm except few isolated pockets of EC range of more than 2250 micromhos/cm.

Block-wise/Aquifer-wise percent area occupied with various levels of EC in ground water of the ACZ is given in Table 1.12-5.

Table 1.12-5 Percent area occupied with various level of EC in ground water of ACZ IV(a)

District	Block	Hydrogeological Unit	Percent area occupied with various level of Electric Conductivity, micromhos/cm

Source: CGWB and RGWD

From the table, it can be seen that 100% area of Gneisses and Gneisses (B.G.C.) aquifer unit in Jawaja block of Ajmer district; Gneisses (B.G.C.) aquifer unit in Begun block of Chittaurgarh district; Phyllite and Schist aquifer unit in Chittaurgarh block of Chittaurgarh district; and Quartzite aquifer unit in Kotra block of Udaipur district have EC level ground water of 750 to 2250 micromhos/cm. It is also depicted from the table that Bhander Sandstone aquifer unit in Nimbahera block of Chittaurgarh district and Erinpura granite aquifer unit in Kumbhalgarh block of Rajsamand district cover 100% area comprising low EC level ground water of less than 750 micromhos/cm.

1.12.3 Long-term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ IV(a) are shown in Figure 1.12-1 to 1.12-86. The supportive data for the same is given in Annex 10.

Udaipur District

Figures 1.12-1 - 1.12-19 presents average chloride and EC concentrations per block for the period 1990-2009 (Odd figures). The graphs present a positive correlation between the Cl and EC long-term trends. The long-term trends of average Cl in most blocks during most of the examined period fluctuate within the range of 100mg/l to 400 mg/l, within the range of concentrations that appropriates for drinking water (<1,000 mg/l). Rishabhdeo and Kherwara blocks have the lowest long-term concentrations with ~100 mg/l; whereas Mavli block has the highest long-term concentrations with up to ~800 mg/l during 2006 (it is still appropriate concentration for drinking water). Most of the blocks retain relative stable long-term concentration trend with negligible changes throughout the examined period.

Average EC long-trends follow very closely the long-trends of average chlorides. The EC values in most blocks are usually between 1,000 and 2,000 µS/cm, within the permissible concentrations for drinking water (<2,500 µS/cm). Mavli Block shows the highest concentrations reach almost 8,000 µS/cm, similarly to the Cl long-trend, most of the blocks retain relative stable long-term of EC values with negligible changes throughout the examined period. Regarding the Cl and EC long-trends, groundwater in the district are suitable for domestic and agricultural purposes. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ VI(a)-009.

Average NO_3 and F concentrations for the period 1990-2009 are presented per block in Figures 1.12-2-1.12-20 (even figures). Nitrates average values in most of the blocks during most of the examined period are between 50 and 200 mg/l; nevertheless, it is mostly below the permissible limit for drinking water (100 mg/l). Mavli and Bhindar

block have the most concentrated record throughout the examined period with values that reaches ~300 mg/l, in both of them, during mid-nineties the average concentration exceeded the permissible limit for drinking water, and stayed above ever since. Generally, nitrate concentration of the groundwater in the district is suitable for drinking, and its long-trend is stable and approximately unchanged (except of Mavli and Bhindar Blocks).

Average F concentrations in most of the blocks during most of the examined period ranged between 0.5 and 2 mg/l, whereas it has been mostly under the permissible limit for drinking water (1.5 mg/l). Sarada Block is the only one that exceeds the permissible limit for drinking water during most of the examined period with concentrations to range between ~1 and ~2 mg/l. Generally, fluoride concentration in the groundwater in the district is suitable for drinking, and its long trend is stable and approximately unchanged.

Sirohi District

Sirohi District is located western to the Aravali Range in the upstream of West Banas River Basin (next to the watershed line between West Banas and Luni River Basins). Large rain depth that flows with relatively sharp gradient southeastwards characterizes the district and significantly affects the chemical quality of the surface water groundwater.

Figures 1.12-21 to 1.12-23 (odd figures) presents average chloride and EC concentrations per block for the period 1984-2009. The graphs demonstrate well the high correlation between the two parameters. The long-term trends of average chlorides in most blocks during most of the examine period fluctuates between 200 and 400 mg/l, significantly lower than the upper limit concentration that is permited for drinking water (< 1,000 mg/l). Generally, the long-term trend is stable throughout the years in Abu Road Block, yet in Pindwara Block there is a relatively small average rise of ~6.79 mg/l/yr. As aforesaid, The district is located in the upstrem of West Banas River Basin and its population density and draft per area are also relatively low (225-300 persons/km^2 and 0.05-0.08 Mm^3/km^2), thus it settels well with the low Cl concentrations throughout the entire examind period in boath blocks.

EC long-trend is high correlated to the Cl concentration long-term trend.Average EC values in the district are usually between 1,000 and 2,000 µS/cm, lower than the upper limit for drinking water (2,500 µS/cm). Generally, the longterm-trend is stable throughout the years in Abu Road block, yet in Pindwara block there is a relatively small average rise of ~22.6 µS/cm/yr (correlated to the chlorides). As aforesaid about the water quality of the upstream of West Banas River Basin, the EC is also affected and thus the values are not high and permited for drinking (regarding to EC).

Average NO_3 and F concentrations for the period 1984-2009 are presented per block in Figures 1.12-22 to 1.12-24 (even figures). Average NO_3 concentrations are usually between 25 and 100 mg/l, mostly below the upper permissible limit for NO_3 in drinking water (100 mg/l). Nitrates long trend is relatively without changes in Abu Road block, whereas in Pindwara block there is a record of relatively small average rise of ~3 mg/l/yr. As aforementioned, here as well these observations reflect relatively low influence of contaminants from the surface combined with large amounts of precipitation and moderate depth to groundwater.

Fluoride concentrations usually range between 1 and 2 mg/l, border line concentration around the upper permited concentration for F in drinking water (1.5 mg/l). The long-term trend of F concentration seem to relatively unchanged throughout the examined time period. The presence of fluoride in the groundwater is probably related to a local and natural geological source.

Rajsamand District

Figures 1.12-25 to 1.12-37 (odd figures) presents average chloride and EC concentrations per block for the period 1984-2009. The long-term trends of average chlorides in most blocks during most of the examine period fluctuates between 100 and 600 mg/l, significantly permissible concentrations for drinking water (lower than 1,000 mg/l). Railmagra, Rajasamand, Khamnor and Amet blocks have rising long-term Cl trend. Most concentrated groundwater are found in Railmagra Block with values mostly between ~400 mg/l and 1,000 mg/l, and its long-term trend is rising with a rate of 19.3 mg/l/yr. Railmagra is downstream to several populated blocks and its depth to groundwater is 10-40 m, thus its Cl concentration is higher than its sorounding and has a rising trend. The rest of the blocks have relatively unchanged long-term Cl trend.

EC trends have positive correlation with the Cl concentrations. Average EC values in the district are usually between 1,000 and 5,000 µS/cm, whereas during most of the examined period and in most of the blocks the concentrations are mainly bellow the maximum allowed value (2,500 µS/cm). Railmagra block has the most concentrated record of EC in groundwater with ~2,000 µS/cm during 1984 and ~5,000 µS/cm during 2009. It also has the fastest raising rate with ~ 64.86 µS/cm/yr. Generally EC long-term-trends are stable with relatively and mostly unchanged values.

Average NO_3 and F levels for the period 1984-2009 are presented per block in Figures 1.12-26 to 1.12-38 (even figures). The nitrate concentrations in most blocks are between 50 and 200 mg/l. In most blocks, the concentration has exceeded or on the permissible limit for drinking water (100 mg/l), and has a rising trend. Most concentrated groundwater is found in Railmagra and Rajsmand blocks, indicating probably on domestic and/or agricultural activity that affects the groundwater.

Fluoride concentrations are presented in Figures 1.12-26 to 1.12-38 (even figures), along with the nitrates. Concentrations have heterogeneity in space and time. In general, concentrations in the district fluctuate between 0.5 and 2 mg/l. In most of the blocks, most of the time, F values are very close and many times higher than the permissible limit for drinking water (1.5 mg/l). Railmagra block presents the highest concentrations with up to 2.5 mg/l. The long-term F trend is relatively stable and unchanged.

Pratapgarh District

The Cl and EC values that are recorded in the district are very good for drinking water. The district is located in the upstream of Mahi River Basin that is characterized with high amounts of precipitation.

Average Chloride and EC concentrations for the period 1984-2009 are presented per block in Figures 1.12-39 to 1.12.41 (odd figures). The long-term trends of Cl are relatively stable and unchanged during the aformentioned period. The concentrations fluctuate around 100 mg/l, significantly lower than the upper permissible limit for drinking water (1,000 mg/l).

EC trends follow follow very closely the chloride trends mentioned above. Average EC levels in the district are usually around 1,000 µS/cm, significantly lower than the permissible limit for drinking water (2,500 µS/cm). Long-term trend of EC values are relatively stable and unchnged during the aforementioned period.

Average NO_3 and F levels for the period 1984-2009 are presented per block in Figures 1.12-40 to 1.12.42 (even figures). Average concentrations range between 50 and 150 mg/l, whereas during most of the period the concentrations have been below the permissible limit for drinking water (100 mg/l). The long-term trend of NO_3 is stable and relatively unchanged during the aformentioned period.

Fluoride concentrations are presented in Figures 1.12-40 to 1.12.42 (even figures). Average concentrations range between ~0.5 and ~1 mg/l, significantly lower than the permited limit for drinking water. The long-term trend of F is stable and relatively unchanged during the aformentioned period.

Chittaurgarh District

Average Chlorides and EC concentrations per block for the period 1990-2009 are presented in Figures 1.12-43 to 1.12-63 (odd figures). The graphs demonstrate well the correlation between Cl and EC. The long-term trend of average chlorides in most blocks during most of the period fluctuate within the range of 100 to 600 mg/l, significantly lower than the maximum allowed concentration for drinking water (1,000 mg/l). Bopalsagar block presents the highest concentrations with large amplitude of fluctuations and a range between ~400 and ~800 mg/l. Most blocks presents stable and relatively unchanged long-term trend, except of Rashmi block that presents decreasing concentrations (~-15mg/l/yr) and Bari Sadri Block that presents rising concentrations (~7.23 mg/l).

EC trends are correlative with Cl concentrations. Average EC levels in the district are usually between 1,000 and 4,000 µS/cm, mostly lower than the permissible limit for drinking water. Bholpalsagar block presents the highest values during the aformentioned examined period with values between ~4,000 and ~8,000 µS/cm. Similarly to the chlorides, most of the blocks presents stable and relatively unchanged long-term trend, except of Rashmi block that presents decreasing concentrations (~-73 µS/cm/yr) and Bari Sadri block that presents rising concentrations (~28.6 µS/cm/yr).

Average NO_3 and F levels per block for the period 1990-2009 are presented in Figures 1.12-44 to 1.12-64 (even figures). Average nitrate concentrations in most blocks are between 50 and 200 mg/l, these concentrations are border line, several blocks presents concentrations above the permissible limit (100 mg/l) while others presents concentrations below the limit. Highest recorded concentration is ~300 mg/l in Bari Sadri, Bhopalsagar and Dungla blocks. The long-term trends have relatively large amplitudes and in most block a rising trend is observed (mostly during the last decade). Begun, Bhinsrorgarh, Chittaurgarh and Gangar blocks present average concentrations that are mainly lower than the permissible limit for drinking water, with relatively stable (low amplitude) long-term trends.

Fluoride concentrations have lower fluctuating amplitudes compared to the nitrates. Generally, concentrations in the district fluctuate between 0.5 – 1.5 mg/l, mostly lower than the permissible limit for drinking water (1.5 mg/l). Dungla block presents the highest concentrations with range between 0.5 – 2 mg/l. long-term trend is relatively unchanged in most blocks except of Dungla Block that presents decreasing concentrations (not significant).

Bhilwara District

Average chloride and EC concentrations per block for the period 1990-2009 are presented in Figures 1.12-65 to 1.12-85 (odd figures). The graphs demonstrate positive correlation between the Chlorides and EC. The long-term trends of average chlorides in most blocks during most of the period fluctuate with mostly large amplitudes between the range 200 and 800 mg/l, mostly lower than the permissible concentration for drinking water (1,000 mg/l). However, average concentrations vary between a minimum of ~200 mg/l in Mandalgarh block and a maximum of 1,200 mg/l in Hurda Block. All blocks except of Hurda presents significantly lower concentrations and long-term trends than the permissible limit for drinking water (1,000 mg/l). Nevertheless, Hurda block presents a moderate decreasing long-term trend with an average of ~5.3 mg/l/yr. There is no clear long-term trend in the district, there are blocks with rising trend like Suwana, whereas others with decreasing like Hurda and Kotri Blocks.

EC trends are correlated to the Cl concentrations mentioned above. Average EC values in the district are usually between 1,000 and 4,000 µS/cm, mostly lower than the permissible limit for drinking water. Hurda and Shahpura blocks have the highest concentrations of chlorides with 2,000 – 4,000 µS/cm. Long-term trend seems stable in most blocks except of Kotri Block that show decreasing values with a rate of 123.8 µS/cm/yr.

Average NO_3 and F levels per block for the period 1984-2009 are presented in Figures 1.12-66 to 1.12-86 (even figures). Average NO_3 is usually range between ~30 to above 300 mg/l; around or little above the permissible limit for drinking (100 mg/l). Raipur block which fond at western side of the district presenting the most high values in the district. Nitrate values rise in this block form of 100 mg/l in 2003 to peck of ~320 mg/l in 2010, a sharp increase of above 30 mg/l/y. In fact most of the blocks recorded significant and consistent increase trends at rate of 0.5 to 7 mg/l/yr. In contrast in Kotri and Asind blocks at the east and north of the block took place a sharp and moderate decrease of 10 and 2.2 mg/l/yr respectively. Virtually, form a spatial view one can see that in the sharp decline rate of the pollution patch in the eastern part of the district around Kotri block is a part of decline trend of larger pollution patch that located northeastern in the area of ACZ IIIa.

Fluoride concentrations are presented in Figures 1.12-66 to 1.12-84, beside with the nitrates. In general, concentrations in this district fluctuate between 0.8 to 2.2 mg/l. In general view one can see that fluoride concentration in this district is higher compared to the other districts in the ACZ. In fact in Bhilwara district at the northeastern side of the ACZ, as can be seen very clearly high concentration are part of widespread contamination patch surrounding all the middle and west part of ACZ – IIIa. The reasons to this distribution pattern is not clear but maybe there is a connection to washing of fluoride minerals form the Aravallis area in the west and the south and accumulation in the downstream. Anyway throw the entire district recording decline trends of 0.05 mg/l/yr or less.

1.13 Groundwater Suitability for Agriculture

Aquifer-wise classification of irrigation water (Shallow Ground water) in ACZ IV (a) is shown in Table 1.13-1.

Table 1.13-1 Aquifer Classification of Irrigation

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
1	Bhander Sandstone	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
2	Deccan Traps	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
3	Erinpura Granite	C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
4	Gneisses	C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
5	Limestone	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
6	Older Alluvium	C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
7	Phyllite & Schist	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
8	Quartzite	C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
9	Shale	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
10	Gneisses(B.G.C.)	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium

It can be seen from the above table that the medium salinity and medium sodium to very high salinity and very high sodium range of irrigation water classes exist in aquifer units Gneisses (B.G.C.) and Erinpura granite of ACZ.

Medium salinity and low sodium to high salinity and medium sodium range of water classes exist in shale aquifer units.

High salinity and medium sodium to very high salinity and low sodium class of water occur in Older alluvium unit of ACZ. In Quartzite unit, however, medium salinity and low sodium to high salinity and medium sodium classes of irrigation water exist.

In Genesis, high salinity and low sodium to very high salinity and high sodium range of irrigation water classes are present.

In Deccan Trap and limestone units, medium salinity and low sodium to high salinity and medium/low sodium water classes occur.

In Bhandar sandstone unit of ACZ the irrigation water classes range from medium salinity and low sodium to high salinity to low sodium classes of water.

As may be seen from classification of irrigation water map of ACZ (Drawing No. ACZ IV(a)-009), the whole of ACZ bear good class irrigation water except isolated pockets in its northern and center part which bears $C_4 S_2$ to $C_4 S_3$ classes of irrigation water.

1.14 Groundwater Draft Village-wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ IV(a). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Ground water Abstractions in ACZ IV (a)

ACZ IVa Total			**1,455.33**	**185.34**	**1,640.67**

Source: Village-wise data of Tehsil, CGWB and RGWD

It may be observed from the above table that total abstractions for all uses in ACZ IVa is 1,640.67 Mm^3 which include 1,455.33 Mm^3 as agriculture draft and 185.34 Mm^3 as domestic and industrial draft.

A total of 7.06 Mm^3 are abstracted from Ajmer district part of the ACZ which include 6.18 Mm^3 as agriculture draft and 0.88 Mm^3 as domestic and industrial draft. The only block Jawaja of the district is having Phyllite/Schist aquifer unit which amount to maximum abstraction of 7.03 Mm^3 in the district.

In Bhilwara district part of the ACZ total 563.00 Mm^3 of ground water is abstracted which include 500.52 Mm^3 as agriculture draft and 62.48 Mm^3 as domestic and industrial draft. A maximum abstraction of 90.26 Mm^3 has taken place in Mandalgarh block and minimum 25.18 Mm^3 abstraction has occurred in Hurda block. Among aquifer units maximum abstraction of 71.15 Mm^3 are obtained from Phyllite/Schist unit in Mandalgarh block of Bhilwara district.

In Chittaurgarh district part of the ACZ total 512.31 Mm^3 of ground water is abstracted which include 469.89 Mm^3 as agriculture draft and 42.42 Mm^3 as domestic and industrial draft. The block Nimbahera of the district is having maximum abstraction of 111.57 Mm^3 and minimum 21.56 Mm^3 in Bhopalsagar block. Maximum 54.68 Mm^3 are obtained from limestone aquifer unit of Nimbahera block of the district.

A total of 109.50 Mm^3 are abstracted from Pratapgarh district part of the ACZ which include 103.94 Mm^3 as agriculture draft and the 5.56 Mm^3 as domestic and industrial draft. The maximum abstraction of 70.15 Mm^3 in Pratapgarh block has taken place in district. Among aquifer units maximum abstraction of 64.56 Mm^3 are obtained from Deccan traps unit in Pratapgarh block of the district.

In Rajsamand district part of the ACZ total 131.36 Mm^3 of ground water is abstracted which include 113.56 Mm^3 as agriculture draft and 17.80 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Khamnor block which amount to 25.27 Mm^3 and minimum 11.74 Mm^3 abstraction has occurred in Deogarh block. Among aquifer unit maximum abstraction of 18.47 Mm^3 are obtained from Phyllite/Schist unit in Railmagra block of the district.

A total of 70.49 Mm^3 are abstracted from Sirohi district part of the ACZ which include 58.13 Mm^3 as agriculture draft and 12.36 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Pindwara block which amount to 44.88 Mm^3 and minimum 25.61 Mm^3 abstraction have occurred in Abu road block. Among aquifer units maximum abstraction of 30.20 Mm^3 obtained from Gneisses unit in Pindwara block of the district.

In Udaipur district part of the ACZ total 246.95 Mm^3 of ground water is abstracted which include 203.11 Mm^3 as agriculture draft and 43.84 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Girwa block which amount to 40.21 Mm^3 and minimum 12.59 Mm^3 abstraction has occurred in Rishabdeo block. Among aquifer unit maximum abstraction of 36.57 Mm^3 are obtained from Gneisses (B.G.C.) unit in Bhinder block of the district.

1.15 Static Groundwater Resources

1.15.1 Static Ground Water Resource (Fresh Ground Water)

The fresh static ground water resources of ACZ IV (a) for year 2010 are given in Table 1.15-1.

ACZ IVa Total			**1,204.28**	**1,640.67**	**136.24**	**Over Exploited**

Note: - Zero availability means negligible value

It may be seen from the table that net ground water availability in the ACZ is assessed as 1,204.28 Mm^3 and draft for all types of uses as 1,640.67 Mm^3. This works out the stage of ground water development in ACZ as 136.24 % giving the zone a ground water Over-Exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ IV(a) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ IV(a)-010.

Of the total 44 blocks of ACZ, 37 blocks in various district covering the ACZ are categorised as ground water Over-Exploited blocks with stage of development to range from 110.98 % (Khamnor block, district Rajsamand) to 199.01% (Kapasan block, district Chittaurgarh). Of the remaining blocks 4 are categorised as Critical and 3 under Semi-critical category.

1.16.2 Dynamic Ground Water Resource (Saline Ground Water)

The assessed net availability of dynamic ground water resource for the ACZ for year 2010 is shown in Table 1.16-1.

District Total			**10.97**
ACZ IVa Total			**23.59**

Note: - Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 23.59 Mm^3. The net ground water availability in Bhilwara district part of the ACZ is 0.40 Mm^3 while that of Sirohi district is 4.32 Mm^3. The net ground water availability of Udaipur district is 10.97 Mm^3. The maximum net ground water availability is in Kotra block of Udaipur district amounting to 9.81 Mm^3.

1.17 Assessment of Groundwater Availability

The net dynamic fresh ground water availability at year 2010 in ACZ IV (a) is 1,204.28 Mm^3 and ground water draft 1,640.67 Mm^3. The stage of ground water development in the ACZ is 136.24% and is categorised as over-exploited ACZ. Saline ground water resource of the zone is assessed at 23.59 Mm^3.

The total static ground water resource in ACZ is assessed at 280.05 Mm^3 out of which only 7.17 Mm^3 is saline ground water.

1. Groundwater Study of Agroclimatic Zone IV (b)

1.1 General

The ACZ covers an area of 11979.32 km^2 and comprises the districts of Dungarpur, Udaipur and Pratapgarh and Banswara. The average annual rainfall in zone is 782.8 mm and mean annual evaporation 214.3 mm.

1.2 Geology

The ACZ IV (b) mostly comprises Pre-cambrian quartzite, phyllite, schist and gneiss group of rocks. The eastern part of ACZ is occupied with Volcanic rocks that constitute basaltic rock formation.

1.3 Hydrogeology

The hydrogeological map of ACZ IV(b) is given in Drawing No. ACZ IV(b)-001. The hydrogeological description of ACZ IV(b) is given in following paragraphs.

The water bearing formations in this ACZ are Gneisses, Ultra-basic, Phyllite, Quartzite, Gneisses (B.G.C.) and Basalt details description is given as follows.

Limestone

This rock unit belongs to the Upper Cretaceous age and has a very limited occurrence near Talwara and Ghatol Blocks of Banswara District. It is pale and massive, partly crystalline, and contains quartz and concretions of mineral chalcedony. The depth of open dug wells in limestone ranges from 22 to 25 m, with yield ranging from 0.29 to 0.35 lps.

Basalt

The basaltic lava flows is dark green to steel gray in colour, fine to medium-grained and porphyritic at places. It is hard, compact and vesicular in nature. Intra-trappeans are not common in this area, but occasionally a thin layer of reddish clayey material, known as redbole, occurs between the two flows. It has a wide distribution in the eastern part of Banswara District in mainly in Banswara, Chhoti Sarvan, Kushalgarh, Sajjangarh Blocks and in Pratapgarh District in Arnod, Peepalkhoont Blocks with total area of 2523.95 km^2. It is jointed in nature. Groundwater occurs at shallow depths and has low water yielding capacity, varying from 0.41 to 0.87 lps.

Ultra-Basics

These rocks comprise serpentinites, hypersthenite and amphibolites, very limited in occurrence to Simalwara block. It is fine to medium-grained, hard and compact and green-coloured. The formation is highly weathered and fractured in the low-lying and valley areas. The occurrence of groundwater is limited to the fractured and weathered parts. This unit has low to medium groundwater exploitation capacity.

Phyllite and Schist

These rocks constitute argillaceous facies of Udaipur Group, and are micaceous and carbonaceous at places. The formation is prone to weathering and varies from place to

place in physical characteristics and mineralogical composition. Groundwater occurs in joints and fractures. The weathered phyllites and schists in this area have low to moderate water yielding capacities. The formation occupies extensive area in the western part of Banswara District around Garhi, Bagidora and Sajjangarh, a major part of Dungarpur District around Bicchiwara, Dungarpur, Seemalwara and Sagwara Blocks. The total area underlain by these formations is 3,552.11 km^2. The thickness of Weathers zone is around 2 to 10m. The yield wells ranges from 0.77 to 12.50 lps.

Quartzite

Quartzites aquifer unit have very limited occurrence around Garhi Block of Banswara District. The yield of wells in these formations ranges from 0.41 to 0.12 lps.

Gneisses (B.G.C.)

This formation is comprised of granite, gneisses and pegmatites and amphibolites. The granite is medium to coarse grained, grey to pink in colour. The gneiss is medium to coarse grained and poorly foliated, jointed and fractured rocks. It occurs in (a) Dhariawad block of Pratapgarh district (b) Aspur and Sagwara blocks of Dungarpur Districts (c) along the Mahi River (d) Peepal Khunt of Pratapgarh district and Garhi blocks of Banswara district. The total area covered by B.G.C. unit is approximately 2368.62 km^2. Groundwater occurs in joints and fractures at shallow depths. It has a low water yielding capacity. Open wells have a depth range of 20 to 25 m and yield from 0.46 to 1.15 lps.

The discharge of tube-wells in these ranges from 0.09 lps at Banswara (granite formation) to 4.03 lps in Chandu Ji Ka Ghoda gneisses and dolomite. Transmissivity is very low in phyllites (2 m^2/day) and high–753 m^2/day–in gneisses and dolomite. Groundwater occurs under unconfined to semi-confined conditions as indicated by the storativity values ranging from 1.00×10^{-1} to 3.2×10^{-3}.

1.4 Main Aquifers units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Table 1.4-1 Main Aquifer Units of ACZ IV (b)

District	Block	Aquifer Units	Area (Km^2)
BANSWARA	Anandpuri	Deccan Traps	16.69
		Phyllite & Schist	328.40

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 9 of Annex 2(b)

From the Table 1.5-1, it may be observed that only hard rock aquifers are encountered in ACZ IV b. The explored aquifer depth ranges from 29 m (Village Lambadabra, block Peepalkhoont, district Pratapgarh) to 215 m (Village Sarwan choti, block Kushalgarh, district Banswara); SWL (bgl) from 0.24m (village Punjjpur, block Aspur, district Dungarpur) to 62.50 m (village Shivpura, block and district Banswara) and well discharge from 0.02 lps (Village Karada, block Sagwara, district Dungarpur) to 22.68 lps (village Sarwan choti, block Kushalgarh, district Banswara).

1.6 Sub-surface Hydrogeology

The cross–section A-A' (Figure 1.6-1 and Figure 1.6-2) has been drawn from Arnod village in the north–eastern part to Bareth village in the south–western part in the Agro-climatic Zone. Total length of the cross–section is 96 kms. The ground elevation ranges from 223 meters (Udaipur Bada) to 52 meters above mean sea level. The cross-section reveals that thickness of older alluvium of Quaternary age is just 2 to 6 meters below ground level. Alluvium is underlain by Basalt of Upper Cretaceous age, Phyllite/Schist of Bhilwara Super Group and Banded Gneissic Complex.

The ground water levels in the area ranges from 9 meters below ground level (Sompura) to 22 meters below ground level (Arnod).

Figure 1.6-1 Hydrogeological Cross Section Line of ACZ IV(b)

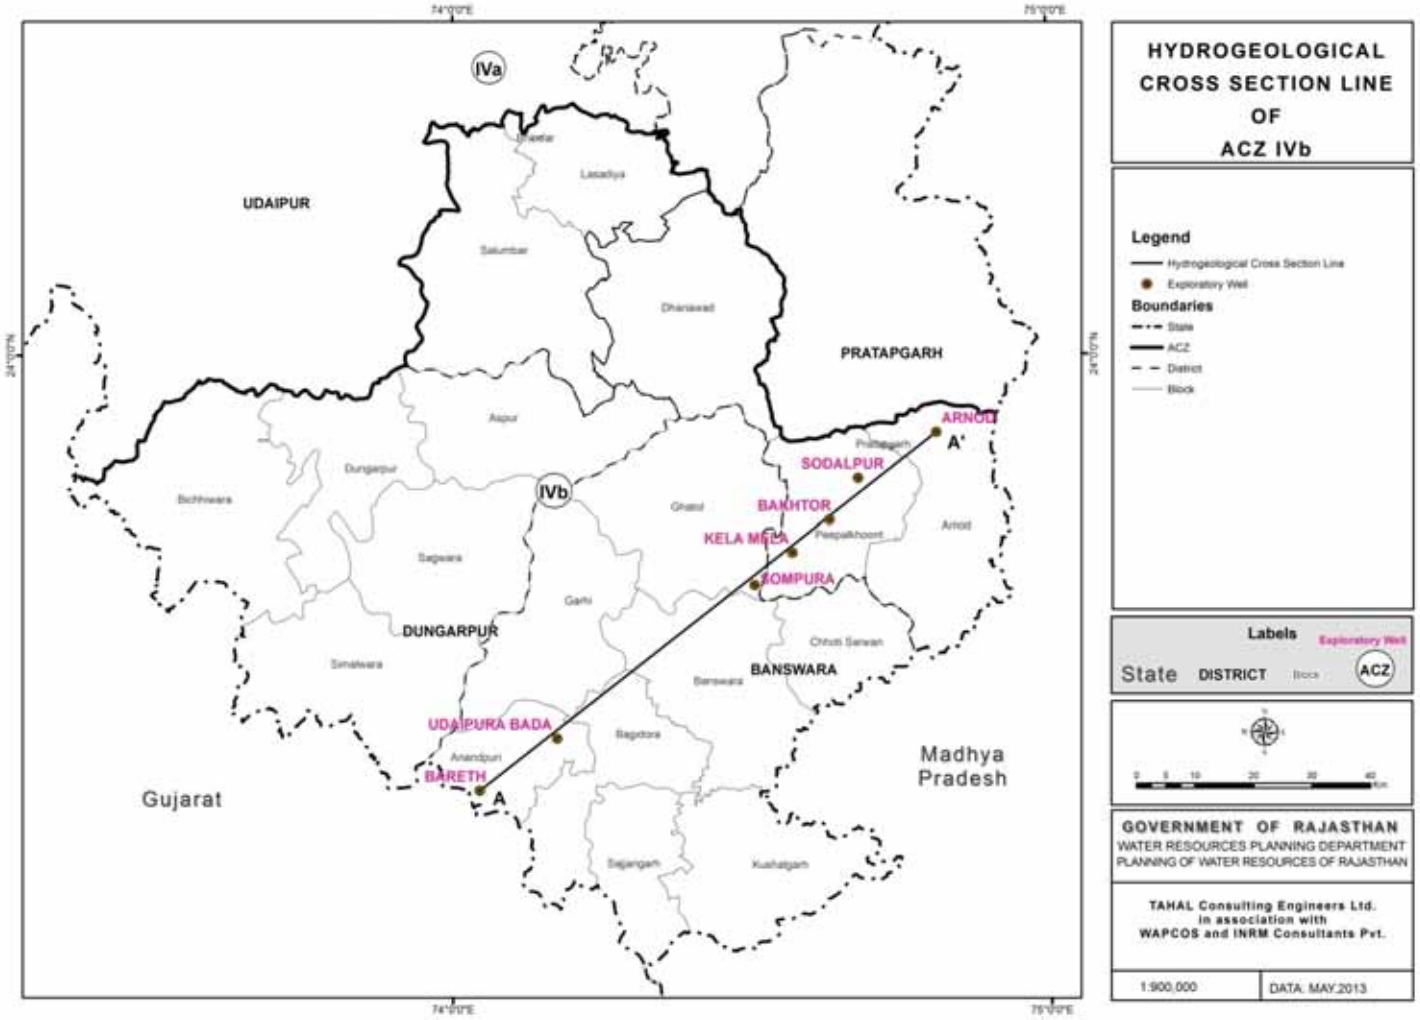

Figure 1.6-2 Hydrogeological cross – section A-A' (Bareth - Arnod)

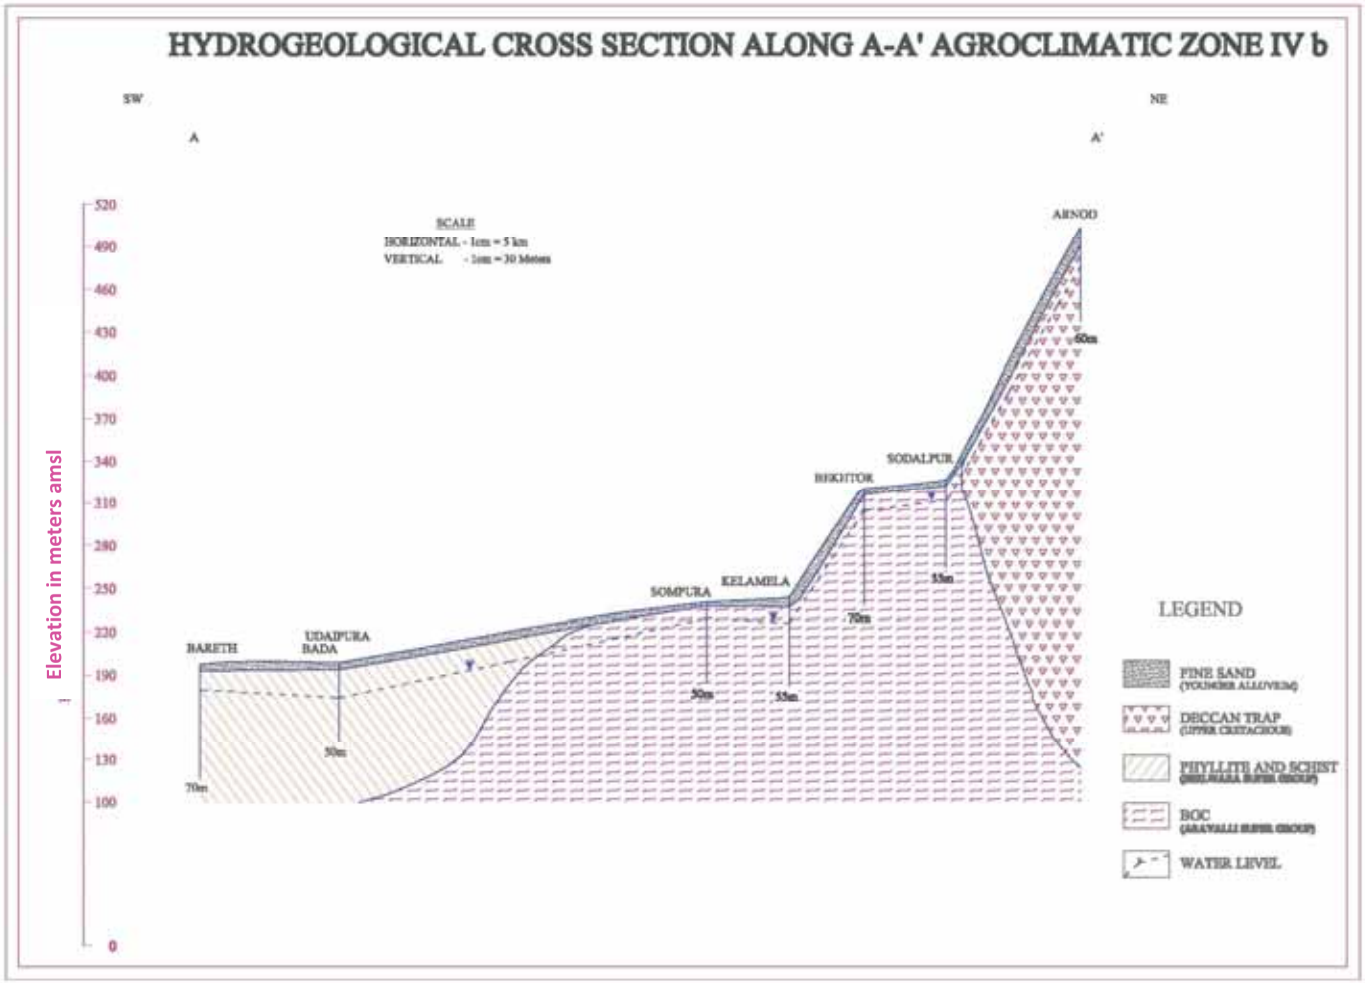

Source: CGWB and RGWD

1.7 Depth to Groundwater

As may be seen from pre-monsoon (2010) depth to ground water level map of the ACZ (Drawing No. ACZ IV(b)-003), the ground water level depths were generally 5 to 20m (bgl) and locally within 2 to 5 m depth in central part of ACZ. The map of post-monsoon (2010) period of the ACZ is at Drawing No. ACZ IV(b)-004.

It can be seen by comparison of seasonal maps that most part of the ACZ (nearly 65%) registered increase in levels as can be seen by the presence of less than 5m depth to water table zones in the post- monsoon map of ACZ.

1.8 Ground water Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ IV (b) in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-wise /Aquifer-wise fluctuation in levels of ground water- ACZ IV (b)

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)

ACZ Summary			**541**	**-2.21**	**10.66**	**3.26**

Source: CGWB and RGWD

As may be seen from the table only sedimentary and hard-rock aquifers exist in this ACZ. The average ground water level fluctuation in sedimentary aquifers ranges from 0.21 m (Limestone) in Dhariawad block of Pratapgarh district to 3.08 m (Limestone) in Garhi block of Banswara district. In hard-rock aquifers the average ground water level fluctuation ranges from – 1.00 m Gneisses (B.G.C.) in Dhariawad block of Pratapgarh district to 6.81 m Gneisses (B.G.C.) in Lasadia block of Udaipur district.

1.9 Ground water Levels and Flow Directions

This ACZ constitutes, virtually, the major part of the Mahi River Basin, a small basaltic (Deccan Traps) portion of the Chambal Basin in the east and part of the Phyllite & Schist country side of the Sabarmati River Basin in the south west. This area, in the southern end of the state, is a mountainous, eastern Aravallies foothills area drained by the Mahi river, which enters Rajasthan from Madhya Pradesh in the south east, and its tributaries. The river flows southwards and debouches into the state of Gujarat. Its main tributaries are the Anas, Jakham, Som and the Moran Rivers.

The country rocks of this ACZ are Phyllite& Schist in the center–western area, including the Sabarmati part, B.C.G. in the center–north, Deccan Traps in the east and some limited Ultra Basics and Limestone outcrops (Map ACZ IVb-001).

The pattern of groundwater level contours, as displayed in the map (see Drawing No. ACZ IV(b)-002), is converging towards the river channels, demonstrating the flow lines as following and controlling the surface drainage pattern, providing for and the base flow which is very typical, and important, in this kind of mountainous basins. The gradient is rather steep all through the ACZ area, mainly along the boundaries in the west and north, the Sabarmati portion in the south west and the eastern, Deccan Trap flank, becoming somewhat moderate to almost flat only along the Mahi channel in the center–south (Map ACZ IVb-002). This configuration is typical to similar mountainous geomorphology in Rajasthan, where the aquifer is virtually a thin, weathered mantle on top of the hardrocks, the water level is, accordingly, very shallow and the water level outline follows the topography. In the particular case of this ACZ the groundwater level

depth throughout the major part of the area does not exceed 10m bgl (Map ACZ IVb-003). In terms of acquiring groundwater it is not necessarily an advantage such as is the case with alluvial aquifers or sandstone and limestone aquifers west of the Aravallies, because the hydraulic properties of these local aquifers are rather poor, and most of the precipitation waters find its way to the surface drainage system and not into the aquifers. It may also imply that groundwater potential in terms of static reserves is virtually negligible and should not be considered as a development trend.

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ IV(b) are shown in Figure 1.10-1 to 1.10-18. The supportive data for the same is given in Annex 9.

1.10.1 Udaipur District

The pre-monsoon average groundwater levels in Udaipur district in the year 1984 vary between a minimum of 248.17 m amsl (Salumber block) and maximum of 418.55 m amsl (Lasadia block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 246.13 m amsl (Salumber block) and a maximum of 416.80 m amsl (Lasadia block). Long-term ground water levels in each block are presented in Figure 1.10-1 to 1.10-2. The level change rates are given in Table 1.10-1.

In Udaipur district, pre-monsoon groundwater levels decline in an average long-term trend of -0.09 to -0.10 m/y.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Salumbar block where average groundwater levels are predicted to reach 241.65m amsl by the year 2060, ~4.5 m below current stages. As a result, 63% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.2 Pratapgarh District

The pre-monsoon average groundwater levels in Pratapgarh district in the year 1984 vary between a minimum of 237.78 m amsl (Dhariawad block) and maximum of 509.39 m amsl (Arnod block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 238.66 m amsl (Dhariawad block) and a maximum of 505.31 m amsl (Arnod block). Long term ground water levels in each block are presented in Figure 1.10-3 to 1.10-5. The level change rates are given in Table 1.10-1.

In various blocks of Pratapgarh district, the rate of decline in pre-monsoon period ranges from -0.02 m/yr in Dhariawad block to -0.08 m/yr in Arnod block. In post-monsoon period the rate of decline range from -0.02 m/yr in Dhariawad block to -0.11 m/yr in Arnod block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Peepalkhoont block where average groundwater levels are predicted to reach 301.89 m amsl by the year 2060, 2.5m below current stages. As a result, 80% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.3 Dungarpur District

The pre-monsoon average groundwater levels in Dungarpur district in the year 1984 vary between a minimum of 177.00 m amsl (Sagwara block) and maximum of 291.28 m amsl (Bichhiwara block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 175.55 m amsl (Sagwara block) and a maximum of 288.51 m amsl (Bichhiwara block). Long term ground water levels in each block are presented in Figure 1.10-6 to 1.10-10. The level change rates are given in Table 1.10-1.

In various blocks of the district the pre-monsoon period change rate of levels range from +0.02 m/yr (rising) in Aspur block to -0.16 m/yr in Simalwara block. In post-monsoon period the rate have a range of +0.002 m/yr in Bichhiwara block to -0.06 m/yr in Simalwara block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Bichhiwara block where average groundwater levels are predicted to reach 286.01m amsl (Pre-monsoon) by the year 2060, 2.5m below current stages. As a result, 71% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.4 Banswara District

The pre-monsoon average groundwater levels in Banswara district in the year 1984 vary between a minimum of 152.48 m amsl (Garhi block) and maximum of 335.08 m amsl (Choti Sarwan block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 153.72 m amsl (Garhi block) and a maximum of 336.77 m amsl (Choti Sarwan block).Long term ground water levels in each block are presented in Figure 1.10-11 to 1.10-18. The level change rates are given in Table 1.10-1.

Long term groundwater levels trend change from block to block between a maximum declining trend of -0.06 m/y in Kushalgarh block to a maximum rising trend of +0.13 m/y in Chhoti Sarvan block. In general, groundwater levels in all blocks can be considered as close to stable in the long term.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the

average calculated rates of watertable change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Banswara block where average groundwater levels are predicted to reach 234.87 m amsl (Pre monsoon)by the year 2060, 1 m below current stages. As a result, 59% of the monitoring wells (CGWB & RGWD) in the block will dry up.

Table 1.10-1 Long-term Groundwater Levels Change Rates– ACZ IV (b) 1984-2010

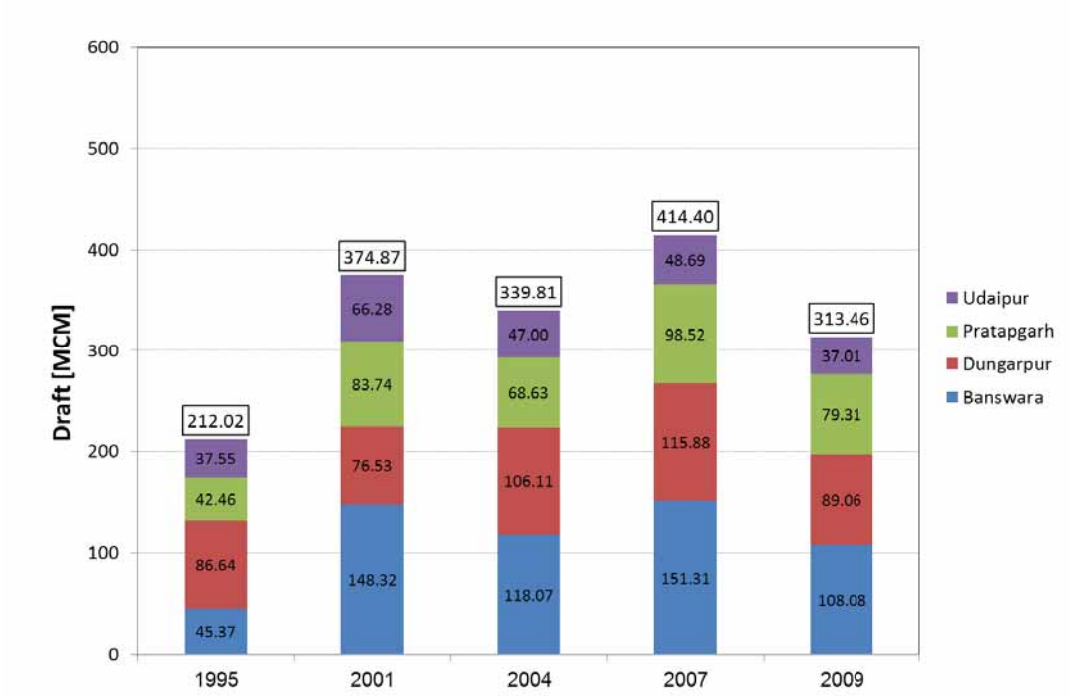
1.11 Long-term drafts

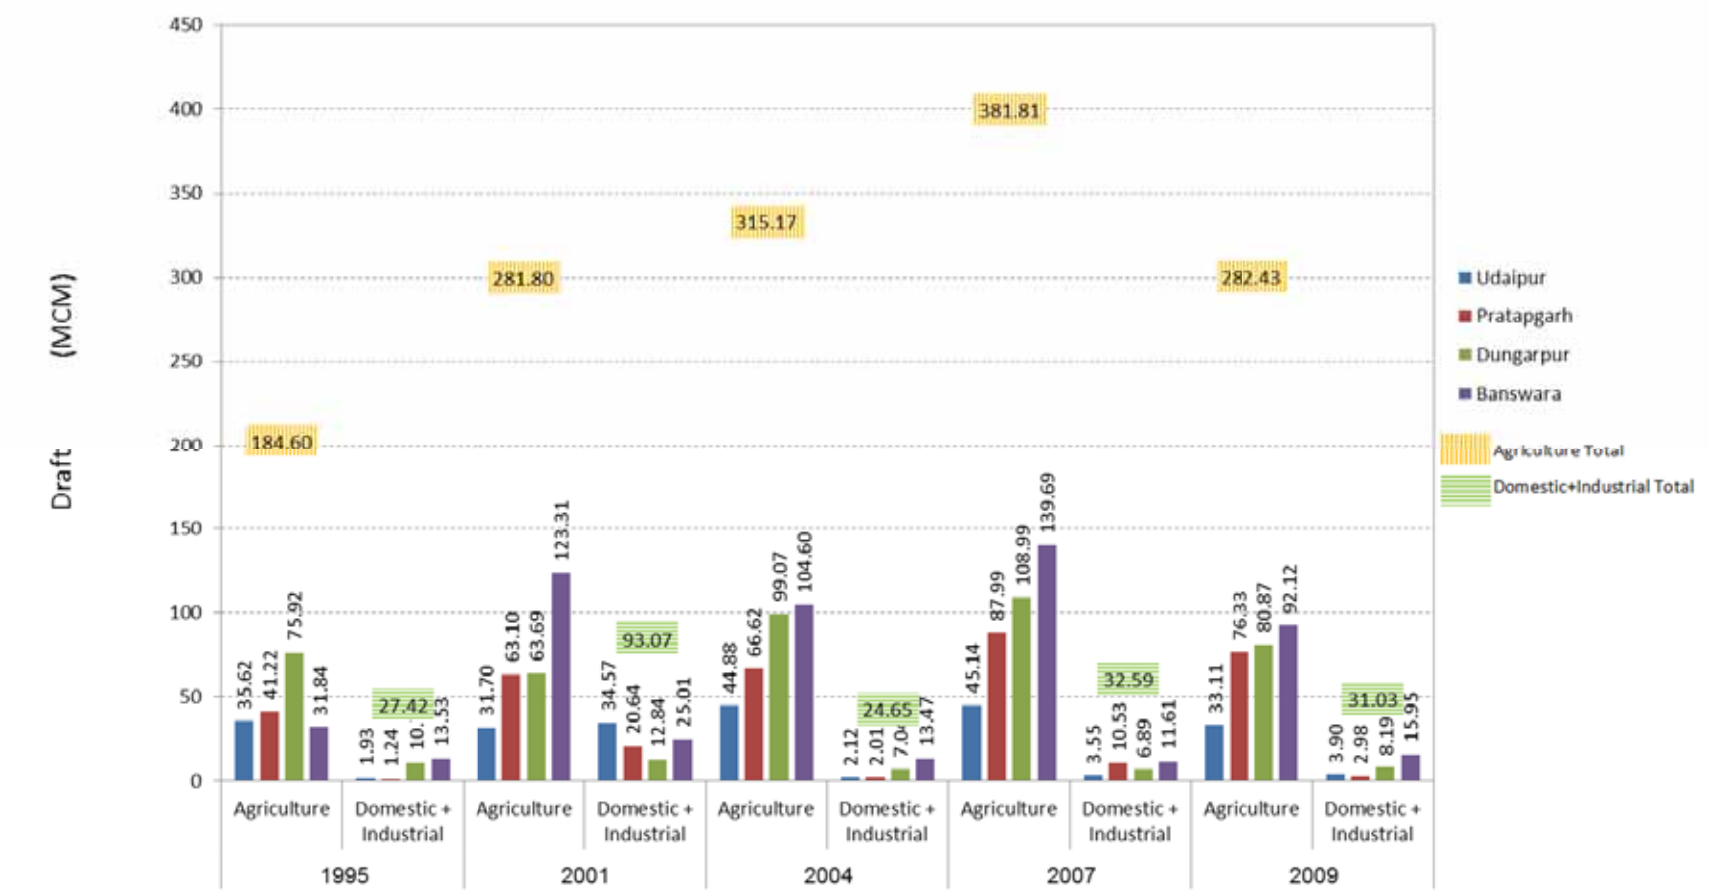
The total draft in ACZ IVb changes without a clear trend throughout the examined time period. The draft increased from 212 Mm^3 during 1995 to 313 Mm^3 during 2009 (Figure 1.11-1, Table 1.11-5). During 2007 the draft was maximal with 414.4 Mm^3 - a relative growth of 95%. Between 1995 and 2009 the relative growth was 48%. The main draft is reported in Banswara and Dungarpur districts with 34% and 28% respectively during 2009 out of the total consumption in the ACZ. In addition, Banswara district shows relatively higher draft per area ratio of 0.057 Mm^3/km^2 during 2007 (compared to 0.024 Mm^3/km^2 during 2009). Udaipur shows the lowest draft in the ACZ during the examined time period with 12% out of the total draft in the ACZ during 2009, but its area is relatively small and its draft per unit area is average for the ACZ (~0.031 Mm^3/km^2) (Figure 8.8). Most of the exploitation of groundwater in the ACZ is for irrigation - during 2009, 282 Mm^3 (90%, Figure 1.11-2) was for irrigation and only 31 Mm^3 (10%) was consumed for domestic & industrial purposes (Figure 1.11-2).

Figure 1.11-1: Total Groundwater Draft in ACZ IVb by Districts 1995-2009



Source: CGWB and RGWD

Figure 1.11-2: Groundwater Draft for Agriculture and Other Uses in ACZ IVb by Districts



Source: CGWB and RGWD

1.11.1 Banswara District

Groundwater draft in this district during 2007 reached 151.31 Mm^3 which comprises 49% out of the total draft in the ACZ. There is no uniform trend during the aforementioned time period, and the draft rose from 45 Mm^3 (0.009 Mm^3/km^2) during 1995 to 151.31 Mm^3 during 2007, and later dropped down to 108 Mm^3during 2009. The relative growth between 1995 and 2007 is 233.48% (Figure 1.11-3). Banswara Block shows the highest draft during the examined time period with ~20% during 2007 and 2009 out of the total draft in the district. Sanjjangarh and Chhoti Sarvan Blocks show the lowest draft in the district with ~5% during 2009 out of the total draft in the district (Figure 1.11-3). The agricultural groundwater consumption comprises ~75 – ~93% out of the average of the total groundwater draft during the aforementioned time period, and until 2007 there is a prominent growth of groundwater usage for that purpose (Figure 1.11-2, Table 1.11-5).

Table 1.11-1 Total Change in Groundwater Draft in Banswara District 1995 -2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Anandpuri	475%	7%	244%
Bagidora	375%	54%	270%
Chhoti Sarvan	139%	160%	141%
Garhi	197%	30%	142%
Ghatol	183%	1%	131%
Kushalgarh	66%	16%	57%
Sajjangarh	147%	51%	114%
Banswara	186%	-8%	116%
District Total	**189%**	**18%**	**138%**

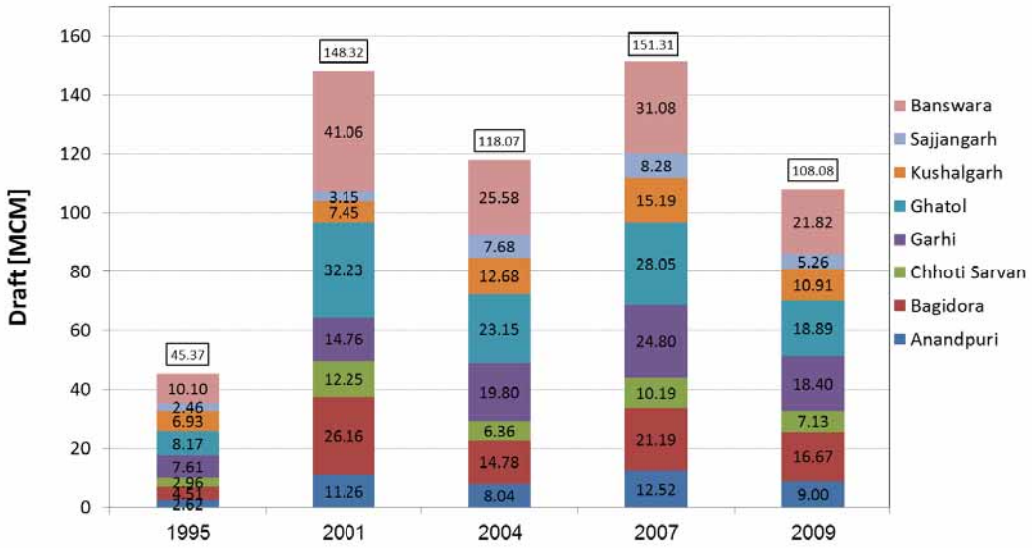
Figure 1.11-3: Total Groundwater Abstraction in Banswara District by Blocks



Source: CGWB and RGWD

1.11.2 Pratapgarh District

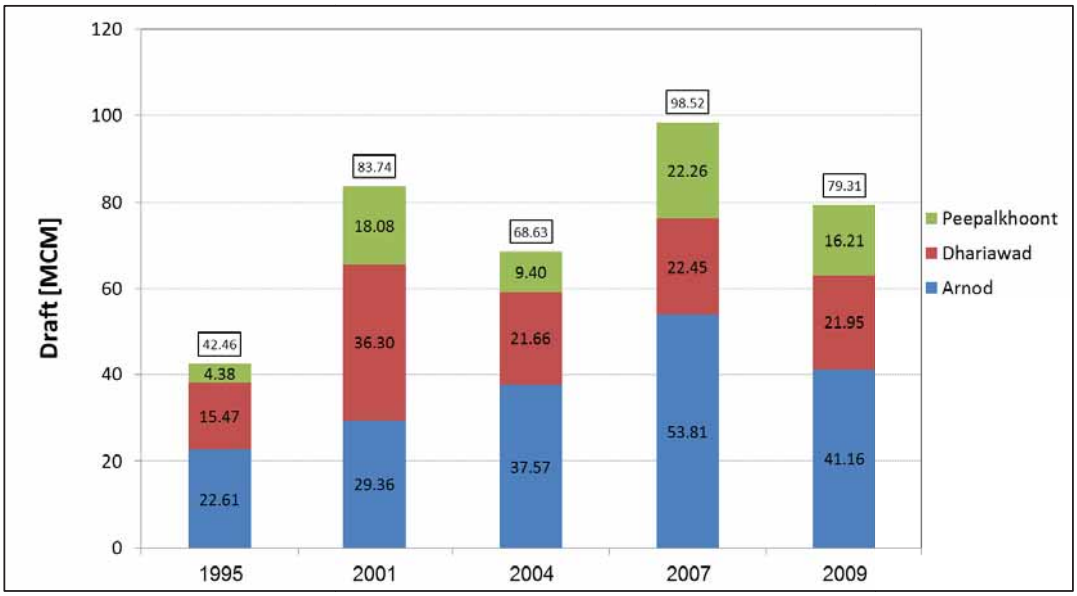
Groundwater consumption ranges from 42 Mm^3 (0.022 Mm^3/km^2) during 1995 to 79 Mm^3 (0.036 Mm^3/km^2) during 2009, and it reached to a maximum value of 98 Mm^3 (0.045 Mm^3/km^2) during 2007– a total increase of 87% within 15 years (Figure 1.11-2, Figure 8.8, Table 1.11-5). Pratapgarh draft comprised 25% during 2009 and 24% during 2007 out of the total groundwater consumption within the ACZ. It is clearly shown in Figure 1.11-4 that Arnod is the main productive block within the district with 52% out of its total draft during 2009 and 55% during 2007. Peepalkhoont block shows the most dramatic changes with 289% increase of agricultural groundwater usage and 62% increase of domestic &industrial groundwater usage (Table 1.11-2).

Table 1.11-2 Total Change in Groundwater Draft in Pratapgarh District 1995 -2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Arnod	+80%	+255%	+82%
Dhariawad	+37%	+149%	+42%
Peepalkhoont	+289%	+62%	+270%
District Total	**+85%**	**+140%**	**+87%**

Source: CGWB and RGWD; Supportive data is located in Table 1.11-5.

Figure 1.11-4 Total Groundwater Abstraction in Pratapgarh District by Blocks



Source: CGWB and RGWD

1.11.3 Dungarpur District

Groundwater consumption ranges between 87 Mm^3 (0.023 Mm^3/km^2) during 1995 and 89 Mm^3 (0.024 Mm^3/km^2) during 2009, whereas during 2007 the draft were maximal with 116 Mm^3 (0.031 Mm^3/km^2) – a total increase of ~3% during 15 years. (Figure 1.11-5, Figure 8.8). The most productive block is Simalwara with 33% during 2009 and 40% during 2007 out of the total draft within the district (Figure 1.11-5). Most of the

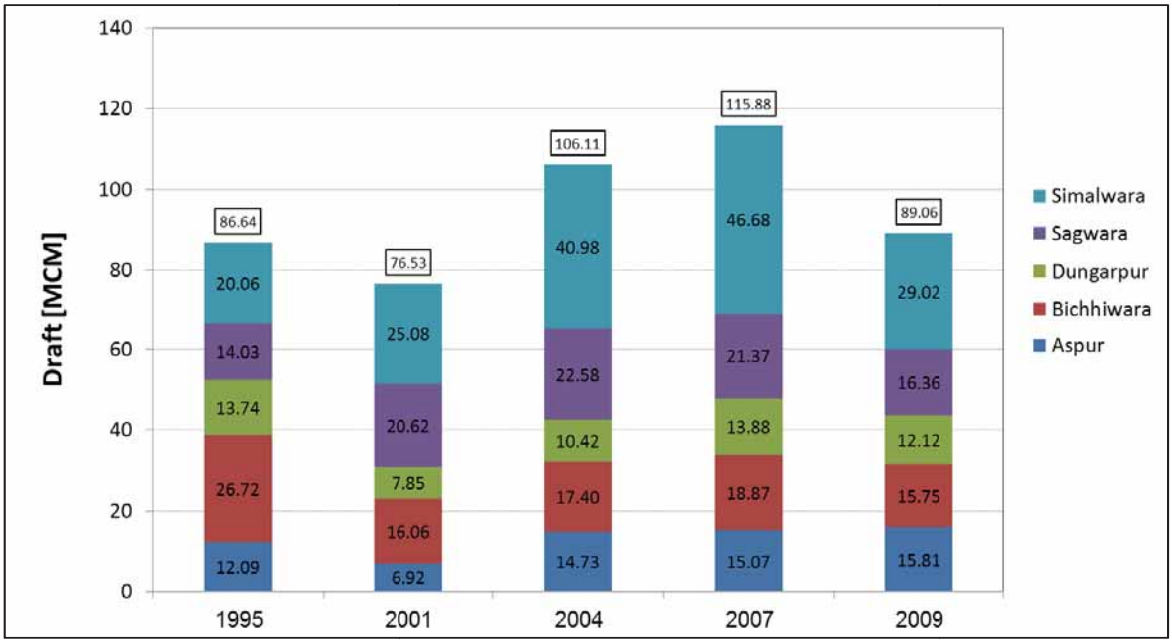
draft is used for irrigation purposes with an average of 94% during the examined time period (Figure 1.11-2). Both Bichiwara and Dungarpur Blocks show a decrease with the drafts for irrigation and for domestic & industrial purposes, whereas other blocks show an increase of the total draft.

Table 1.11-3 Total Change in Groundwater Draft in Dungarpur District 1995 -2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Aspur	40%	-24%	31%
Bichiwara	-39%	-54%	-41%
Dungarpur	-9%	-25%	-12%
Sagwara	18%	7%	17%
Simalwara	51%	-6%	45%
District Total	**7%**	**-24%**	**3%**

Source: CGWB and RGWD; Supportive data is located in Table 1.11-5

Figure 1.11-5 Total Groundwater Abstraction in Dungarpur District by Blocks



Source: CGWB and RGWD

1.11.4 Udaipur District

Udaipur district has the lowest drafts in the ACZ. The absolute change of volume between 1995 and 2009 is minor (decrease of 0.5 Mm^3), but during 2001 through 2007 the volume is significantly higher (Figure 1.11-6). The district is small and comprises only 12% out of the ACZ's area, with an average of 0.031 Mm^3/km^2 (Figure 8.8). Udaipur District has only two blocks that fall in ACZ IVb, Salumbar and Lasadiya. Salumbar Block is significantly larger than Lasadiya, thus has much higher draft. During 2009 the draft in Salumbar was 28 Mm^3 and in Lasadiya 9 Mm^3. In addition, the draft per area ratio is also larger in Salumbar than in Lasadiya with 0.034 Mm^3/km^2

and 0.026 Mm^3/km^2 respectively (Figure 1.11-6, Figure 8.8). The draft in Udaipur are mainly used for agriculture with an average of 89% for irrigation and only 11% for domestic & industrial uses (Table 1.11-5).

Table 1.11-4 Total Change in Groundwater Draft in Udaipur District 1995 -2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Lasadiya	-4%	174%	4%
Salumbar	-8%	85%	-3%
District Total	**-7%**	**102%**	**-1%**

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 3053 villages in ACZ IV(b), 2572 are found suitable for drinking water use, 2981 for irrigation use and 3053 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in ground water is summarised in Table 1.12-1.

Table 1.12-1 Village and block wise water quality

Source: CGWB and RGWD

It may be seen from above that out of 3053 villages of ACZ IVb, 2751 fall under desirable, 301 under maximum permissible limit and 1 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 2297 while number of villages with maximum permissible limit of use is 416 and number of above maximum permissible limit for Fluoride is 340. As regards presence of nitrate in ground water, 2075 fall under highest desirable limit of less than 45 mg/l and 794 under maximum permissible limit along with 184 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 1119 villages fall under maximum permissible limit and 72 under above maximum permissible limit of 2250 microhos/cm and 1862 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

Ground Water Quality of ACZ IV (b) by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ IV(b) is shown in Drawing No. ACZ IV(b)-005. Baring isolated areas in eastern part of ACZ in Arnod block of Pratapgarh district and Bagidora blocks of Banswara district, Aspur and Sagwar and Bichiiwra blocks of Dungarpur district and Salumbar and Lasadiya blocks of Udaipur district, the ground water of the remaining entire ACZ IV (b) occupied by Gneisses (B.G.C.), Phyllite/Schist, basalt and limestone rock units bear fresh ground water in the range of 0-250 mg/l chloride concentration.

Block-wise/aquifer-wise percent area occupied with various levels of Chloride in groundwater of ACZ is shown in the Table 1.12-2.

Table 1.12-2 Percent area occupied with various level of Chloride in ground water of ACZ IV (b)

ACZ IVb Summary			**89.89**	**10.01**	**0.10**

Source: CGWB and RGWD

It can be seen from above table that about 90% area of the ACZ in occupied with fresh ground water bearing aquifers with chloride concentrate of ground water within drinking water standards. Only small area of Basalt, Phyllite/Schist and Gneisses (B.G.C.) units in Dungarpur and Barmer blocks bear chloride level ground water of 250 -1000 mg/l.

Ground Water Quality of ACZ IV (b) by Nitrate

The distribution of Nitrate in ground water (pre-monsoon-2010) of ACZ IV(b) is shown in Drawing No. ACZ IV(b)-006. The most part of the ACZ IV (b) is occupied with good quality ground water as regards the concentration of NO_3 in ground water. The northern part of ACZ area in Lasadiya block of Udaipur district and central part of ACZ in Sagwara block of Dungarpur district, southern part in Bagidora block and eastern part in Garhi block of Banswara district, bear with high level NO_3-rich ground water with concentration of >100 mg/l. (Drawing No. ACZ IV(b)-006)

Block-wise/aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

ACZ IVb Summary			**66.44**	**26.84**	**6.72**

Source: CGWB and RGWD

From the table it can be seen that 100% area of Basalt aquifer unit in Anandpuri and Ghatol blocks of Banswara district; Ultra Basics aquifer unit in Simalwara block of Dungarpur district; Gneisses (B.G.C.) aquifer unit in Bhinder block of Udaipur district are comprising low nitrate level ground water of less than 45 mg/l.

Ground Water Quality of ACZ IV (b) by fluoride

The distribution of Fluoride in ground water (pre-monsoon-2010) of ACZ IV(b) is shown in Drawing No. ACZ IV(b)-007. It may be seen that non-potable quality ground water with fluoride level beyond 1.5 mg/l occurs only in northern-central part of ACZ in parts of Dungarpur district and northern part of Banswara district. The remaining large part of the ACZ occupied with different aquifer units bear potable quality ground water with Fluoride concentration less than 1.5 mg/l.

Block-wise/aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4. .

Table 1.12-4 Percent areas occupied with various levels of Fluoride in ground water of ACZ IV b

ACZ IVb			**73.91**	**14.21**	**11.88**

Source: CGWB and RGWD

It may be seen from the above table that about 12% area of the ACZ contains ground water of poor quality with fluoride content of >1.50 mg/l. The 100% coverage of poor quality ground water belongs to Gneisses (B.G.C.) unit of Dungarpur block of Dungarpur district only. As such, a large part of the ACZ contains usable quality ground water with fluoride level occurring below potable limit.

Ground Water Quality of ACZ IV (b) by EC

The distribution of EC in ground water (Pre-monsoon 2010) of ACZ IV(b) is shown in Drawing No. ACZ IV(b)-008. From map, it may be seen that entire area of ACZ occupied by bed-rock aquifers of basalt. Gneisses (B.G.C.), Ultra basic, Phyllite/Schist and limestone units bear low salinity ground water of <750 to 2250 micromhos/cm except few isolated pockets of EC range of more than 2250 micromhos/cm.

Block-wise/Aquifer wise percent area occupied with various levels of EC in ground water of the ACZ is given in Table 1.12-5.

Table 1.12-5 Percent area occupied with various level of EC in ground water of ACZ IV b

Source: CGWB and RGWD

From the table it can be seen that 100% area of Basalt aquifer unit in Anandpuri, Banswara and Ghatol blocks of Banswara district; Phyllite and Schist aquifer unit in Kushalgarh block of Banswara district; Basalt aquifer unit in Dhariawad block of Pratapgarh district; Gneisses (B.G.C.) aquifer unit in Bhinder block of Udaipur district are comprising low EC level ground water of less than 750 micromhos/cm.

1.12.3 Long term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ IV(b) are shown in Figure 1.12-1 to 1.12-34. The supportive data for the same is given in Annex 10.

Banswara District

Average chloride and EC concentrations per block for the period 1990-2009 are displayed in Figures 1.12-1 to 1.12-15 (odd figures). The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary between a minimum of below 40 mg/l in Chhoti-Sarvan and Kushalgarh blocks at the southern and eastern parts of the district to maximum of above 220 mg/l in Garhi block at the northern side of the district. In fact average chloride values don't pass the Requirement Desirable Limit (250 mg/l) at any block over the years 1990-2009. Long term trend keeps stable throw all the blocks and range between maximum increases of ~3.5 mg/l/y to decrease of ~1.5 mg/l/y. Yet fluctuations of the concentrations are low and therefore in spite of the trends are moderate trends it is not negligible. A general view shows that this area of the state characterize by a number of unique phenomena's:

1. Shallow ground water (below 20 m bgl).
2. Main formations of hard rocks of like Phyllite and Schist.
3. High rainfall volume – often more than 1000 mm/y.
4. Large agricultural projects like "Mahi Bajaj Sagar" that supply much of the irrigation water district

Combination of these factors creates a rapid water cycle and constant enrichment of groundwater. As a result, positive water balance or close to it kept and there is low salt accumulation. As can be seen also form the ground water level increases that characterize the region.

EC trends follow the chloride trends mentioned above in most of the blocks. Average EC levels in the district are regularly below 1,000 µS/cm (permissible limit for drinking is 2,250 µS/cm) and various along the blocks is low. Minimum concentrations of below 400 µS/cm were recorded in Chhoti-Sarvan and Kushalgarh blocks while maximum (average) concentrations are observed in Garhi block (~1,400 µS/cm) Long term trend behave at most of the time similarly to the chloride and so the spatial distribution. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ IV(b)-009

Average NO_3 and F levels per block for the period 1990-2009 are presented in Figures 1.12-2 to 1.12-16 (even figures). Average NO_3 is usually range between 20 to100 mg/l; within the permissible limit for drinking (100 mg/l). Gani block which fond at western side of the district presenting the most extreme values in the district. Nitrate values increase in this block from minimum of ~10 mg/l in 1990 to peak of almost 200 mg/l in 2002. In fact along most of the blocks in the district recorded significant and consistent increase trends of 1 to above 2.5 mg/l/y. Therefore inspite nitrate concentration consider low compared to other ACZ's. In the coming years nitrate concentrations likely to pass 100 mg/l and yet above the Permissible limit for drinking.

Fluoride (F) concentrations are presented in Figures 1.12-2 to 1.12-16, beside with the nitrates. In general, concentrations in this district fluctuate between 0.3 to 1.4 mg/l. In most of the time, F levels are range below or around the required limit for drinking (1.5 mg/l). Long term trends keep stable or close to stability in all the blocks.

Pratapgarh District

Average chloride and EC concentrations per block for the period 1990-2009 are displayed in Figures 1.12-17 to 1.12-19. The graphs show good correlation between the two parameters in most of the blocks. Average concentrations vary between a minimum of ~50 mg/l in Dhariawad block at the north side of the district to maximum of above 250 mg/l in Arnod block at the south-eastern side of the district. Long term trend is presenting increase of ~8 mg/l/y in Arnod block and almost 3 mg/l/y in Dhariawad block. Although concentrations increase rate in this district is slightly higher compared to the other districts in the ACZ and the fact that the eastern part of the district belongs to another river basin (Chambal), one can see that here too chloride concentration is low.

EC trends follow the chloride trends mentioned above in most of the blocks. Again like chloride there are significant differences between the blocks. In Arnod block took place significant increase took palace from below 1,000 µS/cm in the late eighties of the last century to almost 2,000 µS/cm at 2008. In contrast Dhariawad block presenting lower values with more moderate rising trend form ~600 to ~900 µS/cm during the examined period.

Average NO_3 and F levels per block for the period 1990-2009 are displaying in Figures 1.12-18 to 1.12-20 (even figures). Average NO_3 generally range between 40to100 mg/l; below or around the permissible limit for drinking (100 mg/l). Arnod block at eastern side of the district present the most extreme values in the district. Nitrate values increase in this block form minimum of ~30 mg/l in 1990 to maximum of ~140 mg/l in 2010. A significant growth of~5.5 mg/l/y. Therefore, here similar to the anther districts in the ACZ, in spite of nitrate concentration consider low compared to anther ACZ's. Nitrate concentrations in the next years expected to pass Permissible limit for drinking (100 mg/l).

Fluoride concentrations are presented in Figures 1.12-18 to 1.12-20, beside with the nitrates. In general, concentrations in this district fluctuate between below 0.01 to almost 1mg/l. Throw the entire period fluoride concentration keeps below Requirement limit (1 mg/l). Yet, in Arnod block recording significant long term trend increase of almost 0.1 mg/l/y and fluoride concentration except to pass this limit in the next few years. It should be noted that in Dhariawad block took place, opposite trend of decline concentration, at a rate of above 3 mg/l/y. This pattern is not surprising since most the area of the two blocks located in different basins (Chambal and Mahi) and between them possessing watershed.

Source: CGWB and RGWD

Dungarpur District

Average chloride and EC concentrations per block for the period 1984-2009 are presented in Figures 1.12-21 to 1.12-29 (odd Figures). The graphs display good correlation between the two parameters of EC and Chloride in most of the blocks. Average concentrations vary between a minimum of ~70 mg/l in Dungarpur and Simalwara blocks to maximum of almost 400 mg/l in Aspur block at the eastern side of the district. Actually in special view one can see that along all the blocks except for Aspur concentration found below the Requirement Desirable limit of the chloride (250 mg/l). Yet, along the entire district took place slowly but consistent concentration increase trend with rate of 3.5 or less. As we detail earlier in this chapter our assumption is that the responsible to the good quality of the ground water are the rapid ground water cycle and the development drain system of Mahi basin that ACZ IVb passes into its territory. These factors reduce the accumulated salts as a result of evaporation at the surface and increase the leaching salts outside the basin.

EC trends follow the chloride trends mentioned above along the entire district. Average EC levels in the district are regularly below 1,500 µS/cm (permissible limit for drinking is 2,250 µS/cm) and various along the blocks is low. Similar to chloride minimum concentrations of below 600 µS/cm took please in Dungarpur block while maximum concentrations are observed in Aspur block (~2100 µS/cm). Long term trend keeps stable in most of the time and spatial distribution is homogeneous.

Average NO_3 and F levels per block for the years 1984-2009 are displayed in Figures 1.12-22 to 1.12-30 (even figures). Average NO_3 generally range between 20to150 mg/l. In fact in all the blocks except for the blocks in east of the district concentration keeps below or around the permissible limit for drinking (100 mg/l). In the blocks at the eastern side of the district; Aspur and Sagwara, concentration are significantly high and reach pecks of 200 mg/l and beyond of that in some wells. Long term trends presenting moderate to medium increase with rats of 0.5 to 1.5 mg/l/y.

Fluoride concentrations are presented in Figures 1.12-22 to 1.12-30, beside with the nitrates. Concentrations in this district are the highest in the ACZ, especially in the northeastern bocks of the district; Aspur and Dungarpur which presenting average values of 1.5-2.5 mg/l. In general, fluoride concentrations fluctuate between below 0.5 mg/l to almost 3 mg/l. minimum values of 0.5-0.7 mg/l (average) recorded in Simalwara block at the south of the district. The reason to the special distribution pattern in not totally clear but we assume that there is connection between wash of fluoride form the hilly areas in the north of the ACZ toward southeast and accumulation in the mineral fraction in the downstream groundwater

Udaipur District

Average chloride and EC concentrations per block for the period 1990-2009 are displayed in Figures 1.12-31 to 1.12-33. The graphs show good correlation between the two parameters in both blocks. Average concentrations vary between a minimum of ~80 mg/l in Lasadiya bock at the eastern side of the district (from the district area included in ACZ IVb) to maximum of above 450 mg/l in Salumbar block at the western side of the district. Long term trends varied widely between significant increase of ~8 mg/l/y in Salumbar block to stability in Lasadiya bock. General views raise two prominent phenomena:

1) High concentrations difference between the blocks.
2) Worsening of concentration increase trend form the beginning of the decade in Salumbar block.

In spite of that causes to those phenomena are not clear one can see that in Aspur block, the adjacent block south to Salumbar block, concentration in relation to the surrounding blocks significantly higher also. In addition, in Salumbar block recorded acceleration of the salting rate at the parallel period. In fact, hydrologically, Aspur and Salumbar blocks drain the same tributary of Mahi river (Som River), while Lasadiya Block drains another tributary. Therefore can be possibly determine (for a reason not completely clear) that Som River area relatively exposed to chloride pollutions.

EC trends follow the chloride trends mentioned above in most of the blocks. Another time like with chloride there are significant differences between the blocks. In Salumbar block took place significant increase form ~800 µS/cm in the early nineties to peck of almost 2,500 µS/cm at 2007-2008. In contrast Lasadiya block presenting lower values with stable trend around 1,000µS/cm during the examined period.

Average NO_3 and F levels per block for the years 1990-2009 are presenting in Figures 1.12-32 to 1.12-34 (even figures). Average NO_3 commonly range between 50to300 mg/l. In fact, in both blocks at much of the time concentration increase above the permissible limit for drinking (100 mg/l). Those values are high especially relatively to this ACZ. From spatial view apparent that high values concentrate especially in the north side of the district and its part of big pollution patch located in ACZ IVa. Contamination source are not clear, especially conceder the relatively depth ground water. In spite of that, maybe there is connection between medium and large agriculture projects like Jaisamand Lake to large nitrate inputs.

Fluoride concentrations are presented in Figures 1.12-32 to 1.12-34, beside with the nitrates. Concentrations in this district (the part of the district that fall in this ACZ) are varied. In the south of the district (in the area of Salumbar block) concentration is high and usually range between 1-2 mg/l, while in the north-around Lasadiya block constriction are lower and range between 0.5 to 1.5 mg/l. Form a spatial view one can see that high concentration in the south belong to bigger pollution patch located in Aspur and Dungarpur blocks in Dungarpur district. Anyway in both blocks long term trend keeps stable.

1.13 Groundwater Suitability for Agriculture

The aquifer wise classification of irrigation water in report of ACZ IV(b) is shown in Table 1.13-1.

Table 1.13-1 Aquifer Classification of Irrigation

S.No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
1	Deccan Traps	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
2	Limestone	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
3	Phyllite & Schist	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
4	Ultra Basics	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
5	Gneisses(B.G.C.)	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium

It may be seen from above that medium salinity and low sodium class water to very high salinity and medium sodium class water occur in Gneisses(B.G.C.) and phyllite/schist units. Deccan trap and limestone units are occupied with water classes ranging from medium salinity and low sodium to high salinity and low/medium sodium. The water classes in Ultra basics range from medium salinity and low sodium to high salinity and low sodium.

As may be seen from Map (Drawing No. ACZ IV(b)-009) most of the area of ACZ except a small part around Salumbar in northern part of ACZ bears excellent to good quality ground water fit for irrigation.

This entire ACZ bear good to excellent class irrigation water suitable for irrigation.

1.14 Groundwater Draft Village-wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ IV(b). The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Ground water Abstractions in ACZ IV (b)

District	Block	Hydrogeological Unit	Gross Draft in Fresh Groundwater		
			Agricultural, Mm^3/yr	Domestic and Industrial, Mm^3/yr	All Uses, Mm^3/yr

ACZ Total			**292.22**	**59.37**	**351.59**

Source: Village-wise data of Tehsil, CGWB and RGWD

It may be observed from the above table that total abstractions for all uses in ACZ IVb is 351.59 Mm^3 which include 292.22 Mm^3 as agriculture draft and 59.37 Mm^3 as domestic and industrial draft.

A total of 123.30 Mm^3 are abstracted from Banswara district part of the ACZ which include 90.55 Mm^3 as agriculture draft and 32.75 Mm^3 as domestic and industrial draft. The block Banswara of the district amount to maximum abstraction of 29.27 Mm^3 in the district with minimum 6.81 Mm^3 in Sajjangarh block.

In Dungarpur district part of the ACZ total 100.27 Mm^3 of ground water is abstracted which include 83.61 Mm^3 as agriculture draft and 16.66 Mm^3 as domestic and industrial draft. A maximum abstraction of 32.69 Mm^3 has taken place in Simalwara block and minimum 13.31 Mm^3 abstraction has occurred in Dungarpur block. Among aquifer units maximum abstraction of 30.53 Mm^3 are obtained from Phyllite/Schist unit in Simalwara block of Dungarpur district.

A total of 85.53 Mm^3 are abstracted from Pratapgarh district part of the ACZ which include 79.52 Mm^3 as agriculture draft and the 6.01 Mm^3 as domestic and industrial draft. The maximum abstraction of 46.98 Mm^3 in Arnod block has taken place in the district. Among aquifer units maximum abstraction of 46.98 Mm^3 are obtained from Deccan Trap unit in Arnod block of the district.

In Udaipur district part of the ACZ total 42.48 Mm^3 of ground water is abstracted which include 38.54 Mm^3 as agriculture draft and 3.94 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Salumber block which amount to 33.17 Mm^3 and minimum 0.02 Mm^3 abstraction has occurred in Bhinder block. Among aquifer unit maximum abstraction of 17.04 Mm^3 are obtained from Phyllite/Schist unit in Salumber block of the district.

1.15 Static Groundwater Resources

1.15.1 Static Ground Water Resource (Fresh Ground Water)

The fresh static ground water resources of ACZ IV (b) for year 2010 is given in Table 1.15-1:-

ACZ IVb Total			**507.17**	**351.59**	**69.32**	**Safe**

Note: - Zero availability means negligible value

It may be seen from the table that net ground water availability in the ACZ is assessed as 507.17 Mm^3 and draft for all types of uses as 351.59 Mm^3. This works out the stage of ground water development in ACZ as 69.32% giving the zone a Safe status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ IV(b) showing the categorization of villages according to ground water development is shown in Drawing No. ACZ IV(b)-010.

Of the total 20 blocks of ACZ, 2 blocks are categorised as ground water over exploited blocks with stage of ground water development ranging from 136.29 % (block Arnod, district Pratapgarh) to 200.00% (Bhindar block, district Udaipur). Of the remaining blocks 2 are categorised as Critical, 6 as Semi Critical, and 10 under Safe category blocks.

1.16.2 Dynamic Ground Water Resource (Saline Ground Water)

The net availability of saline dynamic ground water resource, in ACZ is assessed as nil.

1.17 Assessment of Groundwater Availability

The net dynamic ground water availability at year 2010 in ACZ IV(b) is 507.17 Mm^3 and ground water draft 351.59 Mm^3. The stage of ground water development in zone is 69.32% and is categorised as safe zone. No saline ground water resource in the zone is assessed.

The total static ground water resource in ACZ IV(b) is assessed at 87.67 Mm^3 and is fresh ground water resource.

1. Groundwater Study of Agroclimatic Zone V

1.1 General

The ACZ covers an area of 26,864.08 km^2 and comprises the districts of Kota, Jhalawar, Bundi, Baran and part of Sawai Madhopur District. The average annual rainfall in zone is 773.4 mm and mean annual evaporation is 206.6 mm.

1.2 Geology

ACZ V mostly comprises Vindhyan group of rock formation such as sandstone, shale and limestone. The southern part of ACZ however, constitute Volcanic group of rocks that chiefly comprise basalt and inter-trapeans.

1.3 Hydrogeology

The hydrogeological map of ACZ V is given in Drawing No. ACZ V-001. The description of water bearing formation ACZ V is given in following paragraphs.

Alluvium

The alluvium group comprises sand, silt, clay and kankar. It occupies a large area in Baran, Bundi and Kota districts. The alluvium is an important aquifer in this agroclimatic zone and sustains most of the groundwater withdrawal. The yield of wells tapping alluvium ranges from 1.16 to 2.31 lps.

The discharge of tube-wells tapping alluvium ranges from 0.62 lps at Keshoraipatan (Bundi) to 1.54 lps at Kapren (Bundi). The value of transmissivity ranges from 60 to 403 m^2/day. The value of storage coefficient (4.92×10^{-4} and 5×10^{-5}) indicates confined conditions in the area.

Bhander Sandstone

The sandstone formation in this zone belongs to Bhander Group of Vindhyan Super Group and is inter-bedded with shale. It is fine to medium-grained, grey to red in colour, compact and highly jointed. It occupies a large area in Baran, Bundi, Kota and Jhalawar districts. The sandstone is quartzitic in nature. Groundwater occurs in joints and fractures and has low to moderate yield in the area. Groundwater generally is withdrawn from this formation through large-diameter open dug wells and tube-wells. The average yield of tube wells in the aquifers range from 4.85 lps to 18.90 lps.

The value of average transmissivity in sandstone ranges from 22.50 m^2/day to 78.00. m^2/day.

Limestone

This is part of Bhander Group of the Vindhyan Super Group. It is fine to medium grained, grey, yellowish, buff-red and chocolate-coloured. The limestone at places is siliceous in nature and resistant to weathering. It is often inter-bedded with shale. It is jointed and cavernous in nature. It occurs around Talara and Keshoraipatan blocks of Bundi district, Anta block of Baran district and Ramganj Mandi block of Kota district, and around Jhalrapatan block of Jhalawar district. Wherever cavernous in nature, the

limestone yields good discharge in wells and tube-wells. The discharge of wells tapping limestone is very poor.

Shale

This litho-unit belongs to Rewa Group of Vindhyan Super Group. It is grey, light green and purple in colour and is splintery in nature. It is inter-bedded with sandstone in the area around Sangod block of Kota district and Sawai Madhopur and Khander blocks of Sawai Madhopur district. It also occupies a large area in Shahabad block of Baran district, Khanpur and Jhalrapatan block of Jhalawar district and Nainwa block of Bundi district. It is jointed and fractured and has low water-yielding capacity ranging from 0.23 to 0.93 lps.

Deccan Traps (Basalt)

This basalt is dark grey, olive green and green in colour, compact, vesicular and amygdaloidal, and is highly prone to weathering. It occupies an extensive area in Jhalawar and Baran districts. Groundwater occurs in fractures and joints, under unconfined conditions. The thickness of the Basalt in this area is more than 200 m. Large-diameter open wells are being constructed for withdrawal of groundwater. The yield of these wells ranges from 1.16 to 1.39 lps.

Phyllite and Schist

Phyllites and shale inter-bedded with quartzite and limestone are part of Bhilwara Super Group and occur only in Hindoli and Nainwa blocks of Bundi district. It is fractured and foliated and has low water yielding capacity. The yield of wells tapping phyllites ranges from 0.23 to 2.89 lps.

Quartzite

The Quartzite aquifer unit has limited areal extent in ACZ V, encountered in parts of Sawai Madhopur and Khander blocks of Sawai Madhopur district. At a few places they are interbedded with Phyllites. The rocks are jointed and fractured but have low ground water potential as they tend to become hard and compact with depth.

Gneisses (B.G.C.)

The formation is comprised of Gneisses and Granites and have small areal extent in parts of Bundi and Sawai Madhopur districts. The gneisses is medium of to coarse grained and poorly foliated, jointed and fractured rocks. It occurs in Keshoraipatan and Nainwa blocks of Bundi district and Khander block of Sawai Madhopur district. The total area covered by Gneisses (B.G.C.) aquifer unit in the ACZ is approximately 10 km^2 only.

1.4 Main Aquifers units

The different aquifer units of ACZ and area occupied by these is shown in Table 1.4-1.

Table 1.4-1 Main Aquifer Units of ACZ V

Source: - CGWB and RGWD

Note: -

1. The data variously pertain to period 1960-2010
2. The same value data reflects the availability of data from one place only.
3. Detailed information on location/village for the above observed parameter values is given in Table 10 of Annex 2(b).

From the Table 1.5-1 it may be observed that explored aquifer depth in older alluvium aquifer unit in ACZ V ranges from 24.40m (village Ganta, block Itawa, district Kota) to 208.00m (village Digod, block Itawa, district Kota); SWL (bgl) from 0.50m (village Lesard, block Keshoraipatan, district Bundi) to 100 m (village Choth ka Barwara block and district Sawai Madhopur) and well discharge from 0.38 lps (village Antarda, block Keshoraipatan, district Bundi) to 25.20 lps (Village Kathoda, block Itawa, district Kota).

In sedimentary aquifers explored depth ranges from 16 m (village Jaloda Khatiyan, block Ladpura, district Kota) to 321 m (village Kasrathana, block Sahahbad, district Baran); SWL (bgl) from 1 m (village Kasrathan, block Shahbad, district Baran) to 87.30 m (village Chakeri, block and district Sawai Madhopur) and well discharge from 0.03 lps (village Dhaulet, block Khairabad, district Kota) to 25.20 lps (village Mau, block Antah, district Baran).

In hard rock aquifers explored depth ranges from 12 m (village Barodiya block Bakani, district Jhalawar) to 240 m (village Sarod, block Jhalrapatan, district Jhalawar); SWL (bgl) from 0.50 m (village and block Pirawa, district Jhalawar) to 63 m (village Shyampura, block and district Sawai Madhopur) and well discharge from 0.13 lps (village Kangriya, block Jhalarapatan, district Jhalawar) to 25.20 lps (village Mandola, block Chipabarod, district Baran).

1.6 Sub-surface Geology

Hydrogeological cross – section A-A'(Keora-Kasathana)

The cross – section A-A' (Figure 1.6-1 and Figure 1.6-2) has been drawn from Keora village in central part of the ACZ to Kasrathana village in the eastern part of the Agroclimatic zone. Total length of the cross – section is 100 kms. The ground elevation ranges from RL 257 meters (Keora) to RL 391 meters (Kasrathana) above mean sea level. The cross – section reveals that the thickness of Older alluvium of Quaternary age comprising fine sand and clay is just 1 to 6 m throughout the cross sectional area. It is underlain by Limestone, Shale and Sandstone bed-rocks of Vindhyan Super Group. Sandstone is the main basement rock encountered in most of the boreholes.

The ground water levels in the area ranges from 14 meters below ground level (Kasrathana) to 20 meters below ground level (Keora).

Hydrogeological cross – section B-B' (Bijora-Niyana)

The cross – section B-B' (Figure 1.6-3) has been drawn from Bijora village in central part of the ACZ to Niyana village in the south-eastern part of the Agroclimatic zone. Total length of the cross-section is 65 kms. The ground elevation ranges from RL 260 meters (Bijora) to RL 321 meters (Mosai Gujran) above mean sea level. The cross – section reveals that Older alluvium of Quaternary age comprising fine sand and clay is occupying only central part of the cross sectional area with maximum thickness of 9 meters and pinches out towards south-eastern side. The cross-section depicts that Limestone, Shale and Sandstone bed-rocks unit of Vindhyan Super Group are the main hydrogeological units in the area. Limestone is occupying north-western part while sandstone and shale occupy south-eastern part of the area.

The ground water level ranges from 7 meters below ground level (Mosai Gujaran) to 24 meters below ground level (Bijora).

1.7 Depth to Groundwater

The pre-monsoon (2010) depth to water table map of ACZ V is at Drawing No. ACZ V-003. Generally it may be seen there from that ground water level depths in ACZ existed within 10 to 20m (bgl) in pre-monsoon of 2010. Locally, however, the levels were shallow in the depth level of 2 to 5m (bgl). The post-monsoon (2010) depth to ground water level of ACZ is placed at Drawing No. ACZ V-004. It may be seen by comparison of two season maps that groundwater level depth zones of 2 to 5m (bgl) expanded due to increase in levels as a result of monsoon rainfall recharge in the ACZ.

1.8 Ground water Level Fluctuation

Block-wise fluctuation in levels of groundwater in ACZ V in various aquifer units for between pre and post monsoon 2010 is shown in Table 1.8-1 (for data refer Annex 2(c)).

Table 1.8-1 Block-wise /aquifer-wise fluctuation in levels of ground water- ACZ-V

District	Block	Hydrogeological Unit	Number of Wells	Min. Fluctuation (m)	Max. Fluctuation (m)	Average of Fluctuation (m)

ACZ Summary			**483**	**-6.85**	**10.60**	**2.49**

Source: CGWB and RGWD

The above table depicts that average ground water level fluctuation in Older Alluvium ranges from 0.19m in Baran block of Baran district to 3.47 m in Sawai Madhopur block of Sawai Madhopur district. In sedimentary-aquifers the average ground water level fluctuation ranges from 0.46 m (Limestone) in Antah block of Baran district to 5.55 m (Limestone) in Hindoli block of Bundi district. The average ground water level fluctuation in hard-rock aquifers ranges from 0.30 m (Basalt) in Chhipabarod block of Baran district to 10.12 m (Quartzite) in Khandar block of Sawai Madhopur district.

1.9 Ground water Levels and Flow Directions

This ACZ constitutes the major part of the huge Chambal River Basin and, in the north, small portions of the Sawai Madhopur and Nainwa blocks within the Banas River Basin, south of the main Banas channel.

The operative aquifers in this ACZ are the Deccan Traps (volcanic), in the south, Sandstone (Bhander) and limestone in the center, upstream area and the Older Alluvium in the north, mainly in the downstream area (Map ACZ V-001). The main tributaries of the Chambal River, which flows from the Gandhi and Rana Pratap sagar towards the Yamuna River in Madhya Pradesh, are the Parwati, Parwan, Kalisindh, Mangli, Kural, Bajaen and Mej rivers, respectively.

The shape of the static water level contour system (see Drawing No. ACZ V-002) is similar to the surface drainage outline. The contours converge along the rivers, and indicate that the river channels maintain, at least intermittently, base flow waters. The Chambal River is the base level and both surface and subsurface waters are drained and conveyed towards the Yamuna system in the east.

Hydraulic gradients in the mountainous rims of the ACZ, in the north, south, west and east are rather moderate, averagely 5m per km, whereas in the huge central area, delineated between Baran, Kota, Bundi and the Chambal channel almost to the outflow, within the Sultanpura, Itawa and Keshoraipatan blocks, the groundwater levels show an area of about 10,000 km^2 of almost flat water level surface, a gradient of about 0.2m per km, occupied by some of the main tributaries, with the Older Alluvium and limestone as the main operative aquifers there (Map ACZ V-002).

Water level depth throughout this ACZ is usually rather shallow, between 20m and less than 10m BGL, displaying a "topographic water level outline". The significance of huge areas where the static water level is less than 10m bgl is that shallow wells equipped with suction (centrifugal) pumps is an advantageous option (Map ACZ V-003). However, it implies that groundwater recharge is rather limited and the operative aquifers (not including the alluvial one which is considered to have favourable, uniform profile) are practically the uppermost, weathered horizons of the formations, the properties of which are not considered to represent the whole bulk of the units. In a few locations, such as some areas in the Sangod, Ladpura and Nainwa blocks the water level surface is somewhat deeper, and in Hindoli block in the west, within the intramontanous area the water level may reach more than 30m' bgl. In terms of pumping facilities the shallow water level within the alluvial area is an advantage, whereas within the hard rock terrain it is not necessarily so, since the shallow water level is mainly an indication of poor transmissivity. The general picture, however, is that groundwater recharge in this ACZ is rather limited and most of the precipitation finds its way to the surface drainage network and, moreover, static water reserves in this area are not a promising development trend.

1.10 Long-Term Water Level Trends

The long-term groundwater level trends of various blocks falling in ACZ V are shown in Figure 1.10-1 to 1.10-25. The supportive data for the same is given in Annex 9.

1.10.1 Sawai Madhopur District

The pre-monsoon average groundwater levels in Sawai Madhopur district in the year 1984 vary between a minimum of 210.14 m amsl (Khandar block) and maximum of 275.54 m amsl (Sawai Madhopur block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 207.12 m amsl (Khandar block) and a maximum of 268.68 m amsl (Sawai Madhopur block). Long-term ground

water levels in each block are presented in Figure 1.10-1 to 1.10-2. The level change rates are given in Table 1.10-1.

In various blocks of Sawai Madhopur district, the rate of decline in pre-monsoon period ranges from -0.05 m/yr to -0.35 m/yr. In post-monsoon period the rates of decline range from -0.07 m/yr in to -0.29 m/yr.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Sawai Madhopur block where average groundwater levels are predicted to reach 249.08 m amsl by the year 2060, 17.5 m below current stages. As a result, 70% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.2 Kota District

The pre-monsoon average groundwater levels in Kota district in the year 1984 vary between a minimum of 218.76 m amsl (Itawa block) and maximum of 333.09 m amsl (Khairabad block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 208.73 m amsl (Itawa block) and a maximum of 324.06 m amsl (Khairabad block). Long-term ground water levels in each block are presented in Figure 1.10-3 to 1.10-7. The level change rates are given in Table 1.10-1.

In various blocks of Kota district, the rate of decline in pre-monsoon period ranges from -0.18 m/yr in Sultanpura block to -0.77 m/yr in Sangod block. In post-monsoon period the rate of decline range from -0.21 m/yr in Sultanpura block to -0.57 m/yr in Sangod block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Sangod block where average groundwater levels are predicted to reach 204.93 m amsl by the year 2060, 27m below current stages. As a result, 85% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.3 Jhalawar District

The pre-monsoon average groundwater levels in Jhalawar district in the year 1984 vary between a minimum of 283.31 m amsl (Khanpur block) and maximum of 431.74 m amsl (Dag block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 276.71 m amsl (Khanpur block) and a maximum of 427.01 m amsl (Dag block). Long-term ground water levels in each block are presented in Figure 1.10-8 to 1.10-13. The level change rates are given in Table 1.10-1.

In various blocks of Jhalawar district, the rate of decline in pre-monsoon period ranges from -0.11 m/yr in Jhalrapatan block to -0.25 m/yr in Khanpur block. In post-monsoon

period the rate of decline range from -0.09 m/yr in Bakani block to -0.20 m/yr in Khanpur block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Pirawa block where average groundwater levels are predicted to reach 354.66 m amsl by the year 2060, 8m below current stages. As a result, 95% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.4 Bundi District

The pre-monsoon average groundwater levels in Bundi district in the year 1984 vary between a minimum of 223.28 m amsl (Keshoraipatan block) and maximum of 327.78 m amsl (Talera block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 218.56 m amsl (Keshoraipatan block) and a maximum of 325.19 m amsl (Talera block). Long-term ground water levels in each block are presented in Figure 1.10-14 to 1.10-18. The level change rates are given in Table 1.10-1.

In various blocks of Bundi district, the rate of decline in pre-monsoon period ranges from -0.13 m/yr in Bundi block to -0.34 m/yr in Nainwa block. In post-monsoon period the rate of decline range from -0.10 m/yr in Talera block to -0.38 m/yr in Nainwa block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Nainwa block where average groundwater levels are predicted to reach 242.80 m amsl by the year 2060, 16.5 m below current stages. As a result, 93% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.10.5 Baran District

The pre-monsoon average groundwater levels in Baran district in the year 1984 vary between a minimum of 241.86 m amsl (Antah block) and maximum of 366.87 m amsl (Shahbad block) while in the year 2010 the pre-monsoon average ground water level vary between a minimum of 237.38 m amsl (Antah block) and a maximum of 366.46 m amsl (Shahbad block). Long-term ground water levels in each block are presented in Figure 1.10-19 to 1.10-25. The level change rates are given in Table 1.10-1.

In various blocks of Baran district, the rate of decline in pre-monsoon period ranges from -0.03 m/yr in Shahbad block to -0.46 m/yr in Baran block. In post-monsoon period the rate of decline range from -0.05 m/yr in Shahbad block to -0.52 m/yr in Baran block.

Presuming that general trends of rainfall and groundwater draft patterns as observed in the last 3 decades will stay similar also in future years; it can be assumed that the average calculated rates of water table change (Table 1.10-1) will also stay similar. Based on these assumptions (using only observation wells data from CGWB & RGWD), groundwater levels were predicted for the years 2020, 2040 and 2060 (Table 1.10-2). Accordingly, the most severe scenario is expected in Atru block where average groundwater levels are predicted to reach 259.57m amsl by the year 2060, ~16 m below current stages. As a result, 93% of the monitoring wells (CGWB & RGWD) in the block will dry up.

1.11 Long-term drafts

Groundwater draft in ACZ V ranges between 1,052 Mm^3 during 1995 and 1,978 Mm^3 during 2009. The volume increase slowly from 1995 to 2001, and its rate accelerates more sharply during 2001 and 2009 (Figure 1.11-1, Table 1.11-6). Throughout the aforementioned time period 93% out of the total average draft were used for irrigation (Figure 1.11-2, Table 1.11-6). During 2004 - 2009 the highest draft was recorded in Kota district with an average of 28% out of the total draft in the ACZ. Furthermore it also has the highest draft per unit area with 0.072 Mm^3/km^2 (Figure 1.11-1, Table 1.11-6). Most of the consumption is for the agriculture sector. Actually, during 2009 1,835 Mm^3 (93%) were consumed for irrigation while only 143.36 Mm^3 (7%) for domestic and industrial uses (Source: CGWB and RGWD, see Figure 1.11-2 and Table 1.11-6).

1.11.1 Sawai Madhopur District

Groundwater draft in Sawai Madhopur District comprises an average value of 11% out of the total usage in ACZ V (two blocks out of five belong to ACZ V, the rest belong to ACZ IIIb). Throughout the examined time period the draft ranges between 101 Mm^3 (0.038 Mm^3/km^2) during 1995 and 200 Mm^3 (0.075 Mm^3/km^2) during 2009 – a total increase of 97% within 15 years (Figure 1.11-3, Table 1.11-1, Table 1.11-6, Figure 8.8). Most of the increase was recorded between the years 1995 and 2004, whereas only minor increase was recorded between the years 2004 and 2009 (Figure 1.11-3, Table 1.11-6). Main productive block is Sawai Madhopur with 59% out of the total draft of Sawai Madhopur district in ACZ V during 2009 (Figure 1.11-3, Table 1.11-6). In both blocks most of the groundwater draft is used for irrigation with an average of 82% (Table 1.11-6).

Table 1.11-1 Total Change in Groundwater Draft – Sawai Madhopur District (within ACZ V) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Khandar	195%	210%	197%
Sawai Madhopur	57%	72%	60%
District Total	**96%**	**101%**	**97%**

1.11.2 Kota District

Groundwater in Kota district comprises on average 25% out of the total usage in ACZ V. Throughout the examined time period the drafts ranges between 180 Mm^3 (0.035 Mm^3/km^2) during 1995 and 503 Mm^3 (0.097 Mm^3/km^2) during 2009 – a total increase of 179% within 15 years (Figure 1.11-4, Table 1.11-2, Table 1.11-6, Figure 8.8). Agriculture is the main usage for groundwater with an average of 92% compared to 8% for domestic & industrial uses (Table 1.11-6). Most of the increase was recorded between the years 1995 and 2004, whereas only minor increase was recorded between the years 2004 and 2009. Main productive block is Sultanpura with 28% out of the total draft of Kota district in ACZ V during 2009 (Figure 1.11-4, Table 1.11-6).

Table 1.11-2 Total Change in Groundwater Draft - Kota District (within ACZ V) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Itawa	780%	756%	778%
Khairabad	98%	594%	120%
Ladpur	147%	788%	170%
Sangod	34%	319%	40%
Sultanpura	389%	646%	399%
District Total	**165%**	**599%**	**179%**

1.11.3 Jhalawar District

Groundwater in Jhalawar district comprises 28% out of the average of total usage in ACZ V. Throughout the examined time period the drafts ranges between 364 Mm^3 (0.058 Mm^3/km^2) during 1995 and 478 Mm^3 (0.076 Mm^3/km^2) during 2009 – a total increase of 32% within 15 years (Figure 1.11-5, Table 1.11-3, Table 1.11-6, Figure

8.8). Agriculture is the main usage for groundwater with an average of 96% compared to only 4% for domestic & industrial uses (Table 1.11-6). The draft is approximately uniform in all blocks between 68 Mm^3 and 88 $Mm^3$for 2009 (Figure 1.11-5, Table 1.11-6).

Table 1.11-3 Total Change in Groundwater Draft - Jhalawar District (within ACZ V) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Bakani	16%	4%	16%
Dag	81%	79%	81%
Jhalrapatan	12%	216%	14%
Khanpur	16%	211%	18%

1.11.4 Bundi District

Groundwater in Bundi district comprises 11% out of the average of total usage in ACZ V. Throughout the examined time period the drafts ranges between 157 Mm^3 (0.035 Mm^3/km^2) during 1995 and 321 Mm^3 (0.073 Mm^3/km^2) during 2009 – a total increase of 104% within 15 years (Figure 1.11-6, Table 1.11-4, Table 1.11-6, Figure 8.8). Agriculture is the main usage for groundwater with an average of 92% compared to only 8% for domestic & industrial uses (Table 1.11-6). Bundi block is more productive compared to other blocks with an average of 49% out of the total draft of the district (Figure 1.11-6).

Table 1.11-4 Total Change in Groundwater Draft - Bundi District (within ACZ V) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Hindoli	25%	142%	31%
Talera	422%	98%	372%
KeshoraiPatan	422%	98%	372%
Nainwa	17%	229%	28%
Bundi	219%	8%	185%
District Total	**106%**	**90%**	**104%**

Source: CGWB and RGWD; Supportive data is located in Table 1.11-6

Source: CGWB and RGWD

1.11.5 Baran District

Groundwater in Baran district comprises ~25% out of the average of total usage in ACZ V. Throughout the examined time period the draft ranges between 249 Mm^3 (0.036 Mm^3/km^2) during 1995 and 476 Mm^3 (0.068 Mm^3/km^2) during 2009 – a total increase of 91% within 15 years (Figure 1.11-7, Table 1.11-5, Table 1.11-6, Figure 8.8). Agriculture is the main usage for groundwater with an average of 95% compared to only 5% for domestic & industrial uses (Table 1.11-6). The main productive block is Baran with an average of 23% out of the total draft of the district (Figure 1.11-7, Table 1.11-6).

Table 1.11-5 Total Change in Groundwater Draft - Baran District (within ACZ V) 1995 – 2009

Block	Change in Agriculture	Change in Domestic and Industrial Uses	Total Change
Antah	94%	404%	102%

1.12 Groundwater Quality

1.12.1 Groundwater Quality-Village/Block Wise

Out of total number of 4,923 villages in ACZ V, 3173 are found suitable for drinking water use, 4713 for irrigation use and 4910 for livestock water use. The details of village-wise assessment of ground water quality is shown in Annex 4.

The usability of water for drinking purpose in number of villages in various blocks of ACZ with regard to highest desirable and maximum permissible limits of the presence of Chloride, Fluoride, Nitrate levels and for irrigation use with regard to presence of Electric conductivity in ground water is summarised in Table 1.12-1.

Table 1.12-1 Village and block wise water quality

ACZ	District	Block	Total Number of Villages	Electrical Conductivity, µS/cm			Chloride, mg/l			Fluoride, mg/l			Nitrate, mg/l		
				Highest Desirable Limit: 750	Maximum Permissible Limit: 2,250	Above Maximum Permissible Limit: 2,250	Highest Desirable Limit: 250	Maximum Permissible Limit: 1000	Above Maximum Permissible Limit: 1000	Highest Desirable Limit: 1.0	Maximum Permissible Limit: 1.5	Above Maximum Permissible Limit: 1.5	Highest Desirable Limit: 45	Maximum Permissible Limit: 100	Above Maximum Permissible Limit: 100

Source: CGWB and RGWD

It may be seen from above that out of 4923 villages of ACZ V, 4419 fall under desirable, 487 under maximum permissible limit and 17 under above maximum permissible limit of use of water for drinking purposes with respect to Chloride levels of ground water in the ACZ. The number of villages for highest desirable limit of use with respect to Fluoride level of groundwater is 1970 while number of villages with maximum permissible limit of use is 1303 and number of above maximum permissible limit for Fluoride is 1650. As regards presence of nitrate in ground water, 3629 fall under highest desirable limit of less than 45 mg/l and 1169 under maximum permissible limit along with 125 with above maximum permissible limit of more than 100 mg/l.

Regarding irrigation use of water 3225 villages fall under maximum permissible limit and 210 under above maximum permissible limit of 2250 microhos/cm and 1488 under desirable and safe limit of water use of irrigation with Electrical conductivity of less than 750 microhos/cm.

1.12.2 Pre-Monsoon-2010 Maps of Groundwater Quality

i) Ground Water Quality of ACZ V by Chloride

The distribution of Chloride in ground water (Pre-monsoon 2010) of ACZ V is shown in Drawing No. ACZ V-005. As may be seen from the map almost all parts of the ACZ bear fresh groundwater of potable quality, the chloride level being in the range of 0-250 mgl, excepting isolated pockets in Jhalawar, Baran and Bundi districts.

Block wise/ aquifer-wise percent area occupied with various levels of chloride in ground water of ACZ is given in the Table 1.12-2.

Table 1.12-2 Percent area occupied with various level of Chloride in ground water of ACZ V

ACZ V Summary			**90.37**	**9.04**	**0.59**

Source: CGWB and RGWD

In the ACZ about 90% area is occupied with fresh ground water with chloride level of <250 mg/l occurring in different aquifer unit of ACZ. About 100% area occupied with Shale, Older alluvium, Sandstone and Phyllite/Schist units bear ground water of potable quality. Also 95% area of Kota district bears potable quality ground water.

ii) Ground Water Quality of ACZ V by Nitrate

The distribution of Nitrate in ground water (pre-monsoon-2010) of ACZ V is shown in Drawing No. ACZ V-006. It may be seen from the map that excepting value in some localized areas where nitrate level is high in different units, almost whole of the ACZ occupied with various aquifer units bear good quality ground water fit for drinking purpose.

Block-wise/aquifer-wise percent area occupied with various levels of Nitrate in groundwater of ACZ is shown in Table 1.12-3.

Source: CGWB and RGWD

It may be seen from the above table that a large part of Baran district (86%), Bundi district (77%), Jhalawar district (70%) and Kota district (83%) belong to potable quality ground water with NO_3 content of below 45 mg/l in various aquifer units.

iii) Ground Water Quality of ACZ V by Fluoride

The distribution of Fluoride in ground water (Pre-monsoon 2010) of ACZ V is shown in Drawing No. ACZ V-007. It may be seen that non-potable quality ground water with fluoride level of 1.5 mg/l occurs mostly in southern and central parts of ACZ covered with Jhalawar district and parts of Baran, Kota, Bundi and Sam district. A large part of Kota, Bundi, Baran and Sawai Madhopur districts of ACZ bear potable quality ground water.

Block-wise / aquifer-wise percent area occupied with various levels of Fluoride in groundwater of ACZ is shown in Table 1.12-4.

ACZ V			**45.64**	**26.14**	**28.22**

Source: CGWB and RGWD

From the table, it can be observed that only 29% area of the ACZ V (b) is occupied with fluoride rich ground water with 95 to 98 % area covering with high level fluoride occurring in Deccan Trap unit of Jhalawar district and Older alluvium of Atru block of Baran district. The Jhalawar district of ACZ cover 64% area with poor quality ground water , whereas Baran, Bundi, Kota and Sawai Madhopur district of ACZ however 7 to 26% covering of poor quality ground water with fluoride level exceeding <1.5 mg/l.

iv) Ground Water Quality of ACZ V by EC

The distribution of EC in ground water (pre-monsoon-2010) of ACZ V is shown in Drawing No. ACZ V-008. From map it can be observed that entire area is occupied with low level salinity in ground water with EC range from <750 to 2250 micromhos/cm excepting isolated pockets in central and southern part of ACZ occupied with basalt, alluvium, limestone and Sandstone units.

Aquifer / block-wise percent area occupied with various levels of EC in ground water of the ACZ is shown in Table 1.12-5.

ACZ V Summary			**31.28**	**64.32**	**4.09**	**0.31**

Source: CGWB and RGWD

It can be seen from the table that almost entire area is occupied with low level salinity in ground water. The table depicts that 100% area of Bhander sandstone aquifer unit in Kishanganj of Baran district; Gneisses (B.G.C.) aquifer unit in Keshoraipatan block of Bundi district; Shale aquifer unit in Talera block of Bundi district; Limestone aquifer unit in Manoharthana block of Jhalawar district; Shale aquifer unit in Itawa block of Kota district; Basalt aquifer unit in Khairabad block of Kota district are comprising low EC level of 750 to 2250 micromhos/cm.

1.12.3 Long-term GW Quality Trends

The long-term groundwater quality trends of various blocks falling in ACZ V are shown in Figure 1.12-1 to 1.12-50. The supportive data for the same is given in Annex 10.

Sawai Madhopur District

Two blocks of this district are located in ACZ V whereas the other three blocks are within ACZ IIIb. The aquifers are the Older Alluvium, Limestone, Shale and Phyllite& Schist, on both sides of the final stretch of the Banas River, debouching into the Chambal River.

Average chloride and EC concentrations per block for the period 1987–2009 are presented in Figures 1.12-1 and 1.12-3. The graphs demonstrate clearly the close correlation between the two parameters, since the Chloride is the main ion. The long-term trends of the average Chloride values are steady 150 mg/l in the Khander block, with a few higher peaks and a fluctuating series of values, in a decreasing trend from 150 to 100 mg/l in Sawai Madhopur block.

The EC trends follow very closely, almost parallel, the Chloride trends. Average levels in both blocks are stable, along the 1000 µS/cm value line, with some minor peaks of

2000 µS/cm. Groundwater suitability for irrigation purpose have been presented in Drawing No. ACZ V-009.

Average NO_3 and F levels per block for the period 1987–2009 are presented in Figures 1.12-2 and 1.12-4, Average NO_3 concentrations are lower than 100 mg/l in the Sawai Madhopur block and decreasing 150–50 mg/l array in the Khander block, in agreement with the permissible limit of 100 mg/l.

Fluoride concentration levels are 0.5 – 1 mg/l, clearly lower than the permissible limit of 1.5 mg/l.

Kota District

This district area encompasses different country rocks/aquifers, namely Older Alluvium, Limestone, Bhander Sandstone and the Deccan Traps. Rainfall is plenty but there is an accumulated, continuous and steady water level decline that amounts to 10–20 m' throughout the period 1984–2009. An outstanding point here is the great difference between the pre and the post monsoon water levels that may reach about 7–8 m' in the Deccan Trap' pointing, on its face value, to rather thin operative aquifers, very low hydraulic properties and poor recharge, all the disadvantages characterizing the local country rocks.

Average chloride and EC concentration per block for the period 1993–2009 are presented in Figures 1.12-5 – 1.12-13 (odd figures). The graphs demonstrate clearly the correlation between the two parameters, since the chloride is the dominant ion. The long-term trends of average chlorides fluctuate along the 200 mg/l, 150 mg/l and the 100 mg/l in Khairabad, Sangod and Ladpura blocks, with an isolated 400 mg/l peak in Khairabad, in 2006 – 2007, and decline from 400 to less than 200 mg/l in Sultanpur and Itawa blocks. All the blocks retain this low level of chloride even throughout water level depletion process, which is a clear consequence of over-exploitation, being far from any salinity source.

EC trends follow very closely the chloride one, along the 1000 µS/cm in the blocks of Sangod, Ladpura and Khairabad and along the 2000 µS/cm level in Itawa and Sultanpura blocks, with a minor decreasing trend in the latter.

Average NO_3 and Fluoride levels per block for the same period, 1993–2009 are presented in Figures 1.12-6 – 1.12-14 (even figures). Average concentration in all blocks is rather low, below the permissible limit of 100 mg/l in Sangod, Ladpur and Khairabad blocks, with a small decreasing trend, and above the 100 mg/l level in the

Itawa block, fluctuating to 200 and 250 mg/l peaks in 2007 and 2010. Needless to say, the origin of these high NO_3 levels in this block is contamination from the surface due to agricultural activity on this mainly Older Alluvium block.

Fluoride concentrations usually follow or fluctuate along the 0.5 and 1 mg/l, with a decreasing tendency in the Sultanpura, Ladpur and Itawa blocks. An outstanding increase, up to 3 mg/l (the permissible limit is 1.5 mg/l) is recorded in Khairabad block, since 2007. It is somewhat illegible since the main aquifer there is the Deccan Traps that are not necessarily the origin of this substance, such as granites, gneisses and their derivates.

Jhalawar District

This district is located at the south – east tip of the Chambal Basin, where the Deccan Trap is the dominating country rock and operative aquifer. The remarkable difference between the pre and post monsoon season water level, such as in other regions within this ACZ, indicate that in terms of hydraulic properties and recharge the area is rather poor, inspite of the very rich rainfall. The lithology and distance from any salinity sources seem to guarantee a generally low concentration of the studied parameters, unless there is a contamination from the surface.

Average chloride and EC concentrations per block for the period 1995-2009 are portrayed in Figures 1.12-15–1.12-25 (odd figures). The graphs demonstrate clearly the close correlation between the two parameters, since the chloride is the dominant ion. The long-term trends of average chloride values point to almost stable 100 mg/l concentration in the Bakani block, where the operative aquifers are the Deccan Traps and the Bhander Sandstone, 200 mg/l, slightly decreasing, in the Khanpur block and fluctuations along an increasing tendency from 200 to 300 mg/l in Piraha, Manohar Thana and Jhalrapatan blocks, where the aquifer is mainly the Deccan Trap volcanic, with unexplainable peak values of 400 mg/l, in the latter two, in 2006 and 2007.

EC trends follow very closely the chloride parameter. Average EC levels are between 1000 and 2000 μS/cm in all the blocks, in a minor, very moderate increase.

Average NO_3 and Fluoride levels are presented in Figures 1.12-16–1.12-26 (even figures). Average NO_3 values are rather low, about 100 mg/l and lower in the Jhalrapatan, Khanpur, Dag and Bakani blocks. In Pirawa and Manohar Thana blocks the concentration fluctuates between 50 and 150 mg/l, the highest permissible limit for this substance, in a moderate, rising tendency.

Fluoride concentration levels in all blocks are lower than the permissible limit of 1.5 mg/l but are arrayed along a rising, although moderate, tendency from 0.5 to about 1

mg/l. It is interesting to note that due to a reason unknown all the fluctuations, that may reach 1.5 mg/l, are all recorded at the second half of the present decade.

Bundi District

This district is located in the northern part of ACZ V, along with two blocks of the Sawai Madhopur District. Its northern part is located within the Banas River basin whereas most of its area, such as almost all the ACZ V area, is encompassed within the Chambal River basin boundaries. The lithology of this district is mainly the Phyllite& Schist, whereas the Limestone, Bhander Sandstone and the Older Alluvium occupy smaller areas. Concentrations of the studied substances are therefore expected to be very low.

Average chloride and EC concentrations per block for the period 1990–2009 are presented in Figures 1.12-27–1.12-35 (odd figures). The graphs demonstrate clearly the close correlation between the two parameters, since the chloride is the dominant ion in all salinity ranges. The long-term trends of average chloride values are arrayed, and slightly decreasing, along the 150 mg/l line in the Talera and Nainwa blocks. In the Keshoraipatan and Hindoli blocks the chloride values fluctuate along the 200 mg/l line, and in the Bundi block the outline is similar until 2005, and later the values become higher, up to 500 mg/l. The reason is likely to be some contamination from the surface.

EC trends follow very close, almost parallel, the chloride values, as well as the same decreasing tendency. The conductivity values in all the blocks are roughly along the 1500 μS/cm line, with almost no deflections.

Average NO_3 and Fluoride levels per block for the period 1990–2009 are displayed in Figures 1.12-28–1.12-36 (even figures). Average NO_3 values moderately fluctuate below the 100 mg/l level, with some higher than 100 mg/l peaks at the end of the decade, in the Nainwa and Keshoraipatan blocks.

Behaviour of the Fluoride concentrations commensurate with the lithological picture, i.e. there is no reason for higher than minimal values. In all blocks, due to a reason unknown, the trends are from about 1 mg/l to about 0.5 mg/l. In the Bundi block (see Figure 1.12-36) it fluctuates to 1.5 mg/l, the permissible limit. There is seemingly no lithological reason for this particular finding.

Baran District

This district is located in the eastern part of ACZ V, and Chambal River basin. The dominating country rock is the Bhander Sandstone, and the other exposed formations are the Shale, The Deccan Trap volcanic, Limestone and Older Alluvium. The remarkable differences between the pre and post monsoon water levels point to rather poor hydraulic properties and recharge. In the alluvial blocks of other parts in this ACZ, such as the Itawa and Sultanpura blocks in the Kota District, the water level differences are small since the dominating aquifer there is the Older Alluvium, characterizes by better hydraulic properties and higher rate of recharge.

Average chloride and EC concentrations per block for the period 1995–2009 are portrayed in Figures 1.12-37–1.12-49 (odd figures). The graphs demonstrate clearly the very close correlation between the two parameters, since the chloride is the dominant ion. The long-term trends of average chloride values display almost steady 100 mg/l concentrations in the blocks of Chhipabarod, Chhabra and Atru, an almost steady 150 mg/l concentration in the Shahbad and Kishanganj blocks and 150–200 mg/l in the Baran and Antah blocks, with 400 mg/l pulse of about 400 mg/l in the latter, at the end of the decade.

EC trends follow very closely the chloride parameter. Average EC levels are 1000 and 1500 µS/cm in all blocks, except the Shahbad and Antah blocks, where the concentration trend is 1500–2000 µS/cm.

Average NO_3 and Fluoride levels are presented in Figures 1.12-38–1.12-50 (even figures). The recorded values are rather low, about 50 to 100 and 150 mg/l in all blocks, and two isolated peak values of 150 (the permissible limit) and almost 200 in Kishanganj and Atru blocks, in 2004.

Fluoride concentration levels are lower than the permissible limit of 1 mg/l, an outline which commensurate with the lithology. In the Baran block, at the end of the decade, two 1.5 mg/l (the highest permissible limit) peak values are recorded.

1.13 Groundwater Suitability for Agriculture

Aquifer-wise classification of irrigation water (Shallow Ground water) in ACZ V is shown in Table 1.13-1.

Table 1.13-1 Aquifer Classification of Irrigation

S. No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
1	Bhander Sandstone	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
2	Deccan Traps	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium

4	Older Alluvium	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium

S. No.	Hydrogeological Unit	Water Class	Salinity/Sodium Hazard
4	Older Alluvium	C_3S_3	High Salinity & High Sodium
		C_3S_4	High Salinity & Very High Sodium
		C_4S_1	Very High Salinity & Low Sodium
		C_4S_2	Very High Salinity & Medium Sodium
		C_4S_3	Very High Salinity & High Sodium
		C_4S_4	Very High Salinity & Very High Sodium
5	Phyllite & Schist	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
		C_3S_3	High Salinity & High Sodium
6	Quartzite	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
7	Shale	C_2S_1	Medium Salinity & Low Sodium
		C_2S_2	Medium Salinity & Medium Sodium
		C_2S_3	Medium Salinity & High Sodium
		C_2S_4	Medium Salinity & Very High Sodium
		C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium
8	Gneisses(B.G.C.)	C_3S_1	High Salinity & Low Sodium
		C_3S_2	High Salinity & Medium Sodium

The above table having salinity/sodium status of various aquifer units depicts that in Gneisses (B.G.C.) unit irrigation class water only high salinity and low sodium to High salinity medium sodium class exists,

In Deccan Trap, limestone, older alluvium, phyllite/schist and shale aquifer units of ACZ V, irrigation water classes range from medium salinity and low sodium class to very high salinity and very high/very high sodium water class.

In Quartzite unit medium salinity and low sodium to high salinity and low sodium irrigation range of water classes occur, whereas in Bhander sandstone unit of ACZ, the irrigation water classes have a range from medium salinity and low sodium to very high salinity and high sodium class of irrigation water.

It may be seen from classification of irrigation water map of ACZ (Drawing No. ACZ V-009), that baring few isolated pockets in central and southern part of ACZ, the entire ACZ bears good to excellent class irrigation water.

1.14 Groundwater Draft Village-wise

Based on data collected from Tehsils for year 2010 the assessments of abstraction of groundwater have been made village-wise. Table 1.14-1 presents block-wise and aquifer-wise assessment of groundwater abstractions in ACZ V. The details of village-wise assessment are given in Annex 5(b).

Table 1.14-1 Ground water Abstractions in ACZ V

ACZ Total			**1,951.92**	**145.99**	**2,097.91**

Source: Village-wise data of Tehsil, CGWB and RGWD

It may be observed from the above table that total abstractions for all uses in ACZ V is 2,097.91 Mm^3 which include 1,951.92 Mm^3 as agriculture draft and 145.99 Mm^3 as domestic and industrial draft.

A total of 574.07 Mm^3 are abstracted from Baran district part of the ACZ which include 541.86 Mm^3 as agriculture draft and 32.21 Mm^3 as domestic and industrial draft. The block Baran of the district is having maximum abstraction which amount to 133.08 Mm^3 and Shahabad block is having minimum abstraction of 37.05 Mm^3.

In Bundi district part of the ACZ total 350.91 Mm^3 of ground water is abstracted which include 330.90 Mm^3 as agriculture draft and 20.01 Mm^3 as domestic and industrial draft. A maximum abstraction of 96.13 Mm^3 has taken place in Keshoraipatan block and minimum 51.14 Mm^3 abstraction has occurred in Talera block. Among aquifer

units maximum abstraction of 72.40 Mm^3 are obtained from older alluvium unit in Keshoraipatan block of Bundi district.

In Jhalawar district part of the ACZ total 499.71 Mm^3 of ground water is abstracted which include 486.27 Mm^3 as agriculture draft and 13.44 Mm^3 as domestic and industrial draft. The block Pirawa of the district is having maximum abstraction of 95.60 Mm^3 with minimum abstraction of 69.91 Mm^3 in Khanpur block. Among aquifer units maximum abstraction of 95.60 Mm^3 are obtained from Deccan traps unit in Pirawa block of the district.

A total of 478.33 Mm^3 are abstracted from Kota district part of the ACZ which include 412.04 Mm^3 as agriculture draft and the 66.29 Mm^3 as domestic and industrial draft. The maximum abstraction of 107.02 Mm^3 in Ladpura block has taken place in district. Among aquifer units maximum abstraction of 94.43 Mm^3 are obtained from older alluvium unit in Itawa block of the district.

In Sawai Madhopur district part of the ACZ total 194.89 Mm^3 of ground water is abstracted which include 180.85 Mm^3 as agriculture draft and 14.04 Mm^3 as domestic and industrial draft. A maximum abstraction has taken place in Sawai Madhopur block which amount to 111.28 Mm^3 and minimum 83.60 Mm^3 abstraction has occurred in Khander block. Among aquifer unit maximum abstraction of 47.26 Mm^3 are obtained from older alluvium unit in Sawai Madhopur block of the district.

1.15 Static Groundwater Resources

1.15.1 Static Ground Water Resource (Fresh Ground Water)

The fresh static ground water resources of ACZ V for year 2010 are given in Table 1.15-1.

Table 1.15-1 Fresh static ground water resources of ACZ V

District	Block	Hydrogeological Unit	Static Groundwater Resources, Mm^3

ACZ V Total			**1,869.08**	**2,097.91**	**112.24**	**Over Exploited**

Note: - Zero availability means negligible value

It may be seen from the table that net ground water availability in the ACZ is assessed as 1,869.08 Mm^3 and draft for all types of uses as 2,097.91 Mm^3. This works out the stage of ground water development in ACZ as 112.24 % giving the zone an Over-Exploited status. The village wise fresh dynamic resources and stage of development are given in Annex 6(b). The village wise map of ACZ V showing the categorization of villages according to ground water development is shown in Drawing No. ACZ V-010.

Of the total 25 blocks of ACZ, 17 blocks in various district covering the ACZ are categorised as ground water Over-Exploited blocks with stage of ground water development to range from 103.35% (Khandar block, district Sawai Madhopur) to 163.91% (Atru block, district Baran). Of the remaining blocks 2 are categorised as Critical, 5 as Semi-Critical and 1 under Safe category.

1.16.2 Dynamic Ground Water Resource (Saline Ground Water)

The assessed net availability of saline dynamic groundwater resource for the ACZ for year 2010 is shown in Table 1.16-2.

ACZ V Total			**2.75**

Note: - Zero availability means negligible value

It may be seen from the table that net dynamic saline groundwater availability in the ACZ is assessed as 2.75 Mm^3 only. The net ground water availability in Sawai Madhopur district part of the ACZ is 2.75 Mm^3 while that of Bundi district is nil. The maximum net ground water availability is 2.75 Mm^3 in Khandar block of Sawai Madhopur district.

1.17 Assessment of Groundwater Availability

The net dynamic fresh ground water availability at year 2010 in ACZ V is 1,869.08 Mm^3 and ground water draft 2,097.91 Mm^3. The stage of ground water development in zone is 112.24% and is categorised as Over-Exploited. Saline ground water of the zone is assessed at 2.75 Mm^3 only.

The total static ground water resource in ACZ V is assessed at 942.35 Mm^3. Out of which only 4.59 Mm^3 is saline ground water.
